CMB PLANNING DEPT
RECEIVED

Dear Mr. Mooney,

This report provides an assessment of potential noise and sound impact at the above referenced property in conjunction with the Applicant's request for a conditional use permit for a Neighborhood Impact Establishment. This study is based on two site visits during which we were able to inspect the neighborhood, take photographs and gather acoustical measurement data for analysis.

Satellite images, architectural drawings, photographs and acoustical measurements in graphic format are provided to support our findings and recommendations. I welcome any comments or questions you and your staff may have pertaining to our sound study and look forward to assisting in any way possible.

Respectfully submitted,

Donald J. Washburn
President

THE AUDIO BUG, INC.

3800 HILLCREST DRIVE, # 102 • HOLLYWOOD, FL 33021-7937 • PHONE: 954-983-2788 • FAX: 954-983-2789 • audiobug1@aol.com

Acoustical Data Analysis

We conducted a site survey on Friday, November 13, 2015, beginning just after 11:00 p.m. Two sets of sound level measurements were taken along Washington Avenue between 6th and 7th Streets to quantify ambient noise levels. These measurements confirm that the most significant acoustical impact on the area is that of traffic noise.

The first represents a 5-minute period measured on the southeast corner of the intersection of Washington Avenue and 7th Street starting at 11:25 p.m. Here, the equivalent sound level (LA_{eq}) registered 68.7 dBA with a peak level (LA_{max}) registering 79.6 dBA. The ambient noise level (LA_{90}) registered 58.2 dBA.

The second measurement was recorded over a 30-minute period starting at 11:38 p.m. It represents sound levels observed while walking along both sides of Washington Avenue. The graph clearly illustrates the ebb and flow of traffic. LA_{eq} registered 68.0 dBA with peak levels (LA_{max}) in excess of 85 dBA representing the louder sounds typical of buses and motorcycles which regularly traverse this busy roadway. The ambient noise level (LA_{90}) registered 57.4 dBA.

We next performed a computer-assisted analysis of a simulated sound system suitable for this rooftop venue to analyze its sound propagation characteristics at various points of observation. Sound level maps and sound pressure levels at selected distances from the rooftop appear on pages 9 through 11. The system shown consists of 20 loudspeakers evenly distributed around the perimeter of the pool deck. These were adjusted to provide a uniform program level of 82 dBZ (unweighted), which is representative of moderate entertainment sound levels. Under these conditions, sound levels at the front façade of the Arcadia House Condo are predicted to be 68 dBZ or 62 dBA. This is 5 dB higher than the measured ambient noise level (LA_{90}) of 57.4 dBA and 6 dB lower than the measured LA_{eq} of 68.0 dBA. This 6 dB difference illustrates the previously mentioned masking effect provided by the traffic noise. In this case music would be perceived at a level 6 dB below the ambient noise present at the front façade of Arcadia House Condo. An additional advantage would be provided by the structure itself, especially when windows are closed.

The Applicant intends to limit hours of operation for entertainment on the pool deck to 8:00 p.m. Background music will extend beyond 8:00 p.m. until closing. Entertainment levels inside the restaurant will cease at 1:00 a.m. This will ensure that residents across the street will not be impacted during normal sleeping hours, 11:00 p.m. to 7:00 a.m. This provides an addition level of protection from unwanted noise throughout the neighborhood.

Summary

Sound generated by the rooftop pool deck's music system should be controlled to prevent excessive spill into the environment. Utilization of the attached sound system design specification will ensure that levels be maintained consistent with the concept of "entertainment level music." Maximum sound levels of 82 dBZ will result in sound levels 240 feet from the pool deck of 68 dBZ / 62 dBA or less, close to or below local long-term ambient noises levels (L_{90}) of 57.4 dBA. Traffic noise will introduce substantial masking of any music heard at this distance.

With a properly designed and calibrated sound system, the introduction of the rooftop pool deck venue into this neighborhood will have no negative noise impact on neighboring residential properties. The size and scale of the space should not significantly increase activity in the area. Restricted hours of operation of the sound system and the constant background noise of traffic will contribute to mitigating any impact that might be envisioned.

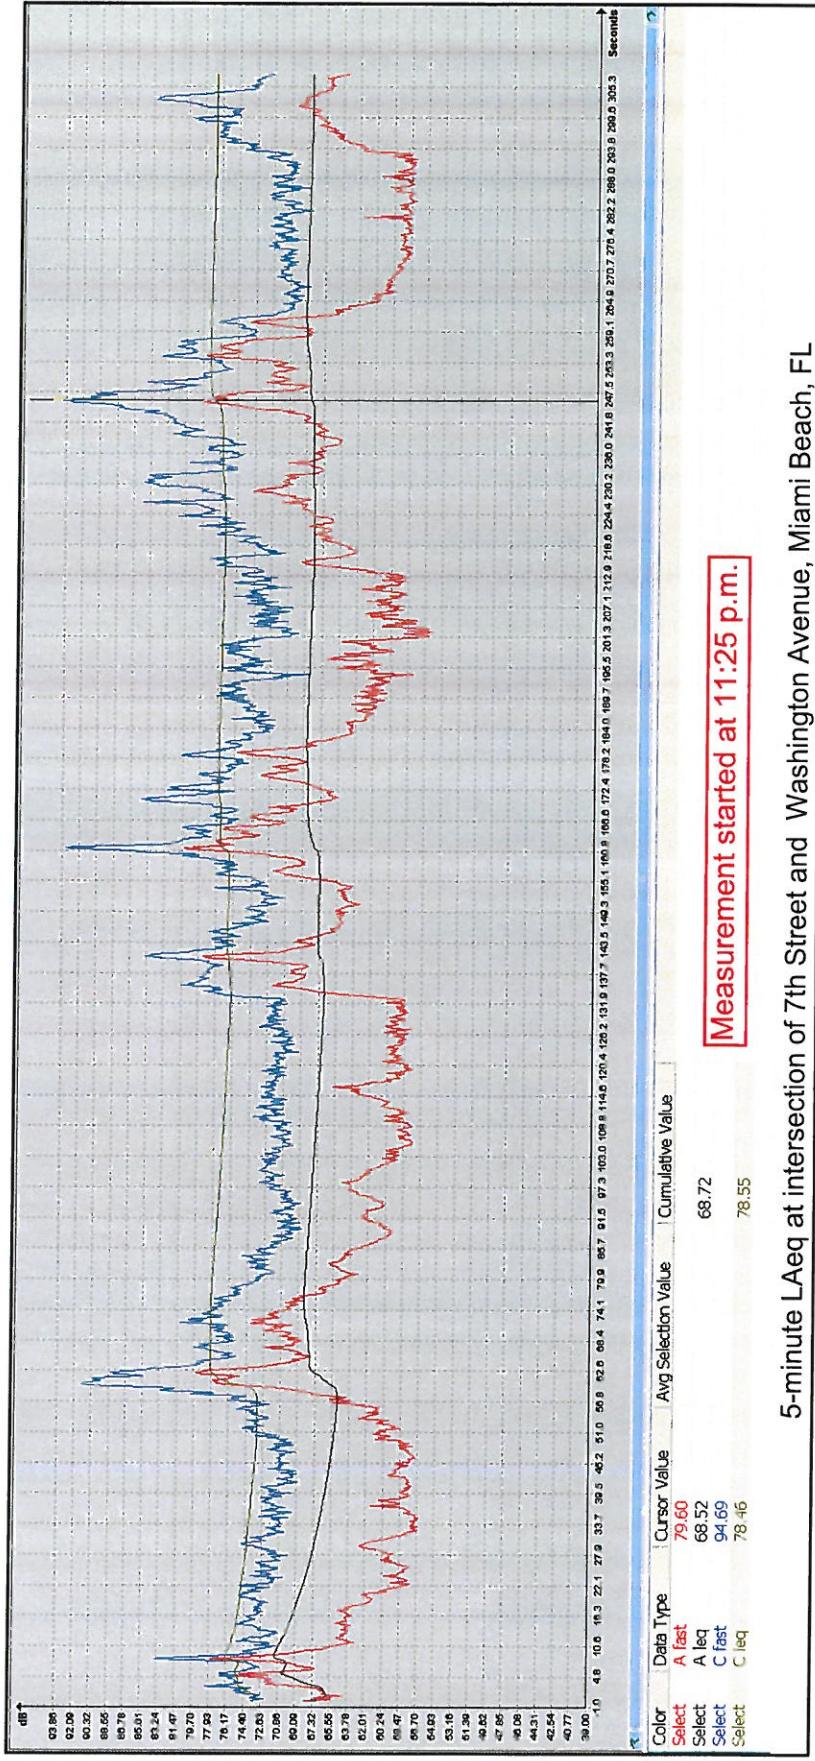

In my professional opinion, the proposed rooftop pool deck venue will have no adverse impact on neighboring residential properties nor will it present any violations of the City of Miami Beach's Noise Ordinance.

Rooftop Sound System Specification

601 Washington Avenue, Miami Beach, Florida

Systems for the rooftop outdoor venue shall be designed to fully comply with local noise ordinances, employing several special techniques to accomplish this goal. These techniques include:

- A. Deployment of multiple small, closely spaced speakers driven at low individual volumes. The system design is intended to physically distribute sound uniformly within the listening area in such a manner as not to interfere with normal conversational level of the clientele. Maximum long-term system levels will be limited to LeqA 78 dB/LeqC 82 dB (measured at 10 ft.) with user access restricted to the selection of program material and manual reduction only of system levels. No increase above maximum design sound levels shall be possible.
- B. Size of outdoor speakers shall be limited to small woofers (not to exceed 8" nominal) incapable of producing appreciable levels of low frequency energy, as lower frequencies (longer wavelengths) can travel greater distances than higher frequencies (shorter wavelengths). The lowest frequencies, which are essential to the reproduction of musical styles such as hip-hop and rap, are to be significantly attenuated by electronic means.
- C. A BSS "Soundweb™ London" Digital Signal Processing System (or approved equal), a centralized computer control and digital signal processor, shall form the heart of each system. With this device, the system is equipped with the following functions:
 1. All controls under lock and key, with limited access via password security.
 2. The system will provide for preset maximum level and equalization.
 3. Local control will consist only of source selection and the ability to turn the system down.
 4. A leveling program which will minimize the inevitable disparities between source and selection volumes, further ensuring consistent playback levels.
- D. All outdoor speakers shall be oriented in such a way as to minimize sound propagation towards adjacent properties. A combination of ground-mounted and wall-mounted speaker systems shall be permitted as dictated by site conditions. Only the system installers and programmers shall have access to the full complement of controls and adjustments, ensuring compliance with the stated standard. Volume levels will be automated so as not to exceed the specified maximum, predetermined level. Once final adjustments have been made to the system, all controls are to be locked to prevent intentional or inadvertent adjustments.
- E. Live entertainers and DJs will be prohibited from bringing portable loudspeakers and amplifiers to the venue. They will only be permitted to provide their own music sources (computers, iPads, iPods, CD players, turntable) and mixing console. Connections will be provided at locations to be selected during the sound system design process.

The system, once completely installed, shall be tested and adjusted under the supervision of Don Washburn of the Audio Bug, Inc. to ensure that all aspects of the system's performance comply with the design intent, City Ordinance and good technical practices.

A Guide To Acoustical Terms and Definitions

NOISE LEVEL ANALYSIS TERMS

Sound Pressure Level (SPL) = The RMS sound pressure expressed in dB re 20 microPa, the lowest threshold of hearing for 1 kHz for a healthy auditory system. [As points of reference, 0 dB-SPL equals the threshold of hearing, while 140 dB-SPL equals irreparable hearing damage.] See: **inverse square law** below. 1 Pascal = 94 dB SPL. Average face-to-face conversation equals approximately 65 dB SPL.

Decibel (dB) = means of expressing power ratios, i.e. the difference between two sound levels, or an absolute sound level expressed in Sound Pressure Level (SPL) referenced to a standard pressure, i.e. 94 dB SPL = 1 Pascal.

dBA = "A" weighted sound pressure level. Please refer to the attached discussion of weighting filters and their applications.

SLM = Sound Level Meter. Device used to measure sound pressure levels.

L_{min} = Lowest, or softest, Sound Pressure Level measured during the test period.

L_{max} = Highest, or loudest, Sound Pressure Level measured during the test period.

L_{eq} = Equivalent continuous sound level. The steady level which would produce the same sound energy over the test period as the specified time-varying sound. This figure is useful for studying long-term trends in environmental noise. A single L_{eq} number is often used to define an entire measurement period.

L₁₀ = Sound level exceeded 10% of the measurement period. Highest of the L_n figures.

L₅₀ = Sound level exceeded 50% of the measurement period. Median of the L_n figures.

L₉₀ = Sound level exceeded 90% of the measurement period. Lowest of the L_n figures. This figure is most commonly used in estimating true ambient noise level.

L_{mean} = Mathematically averaged Sound Pressure Level.

NC = Noise Criteria, a standardized method of characterizing noise loudness. Extensively used in the analysis of noise and vibration.

Sone = a subjective unit of loudness for an average listener equal to the loudness of a 1 kHz. sound that has an intensity 40 decibels above the listener's own threshold of hearing.

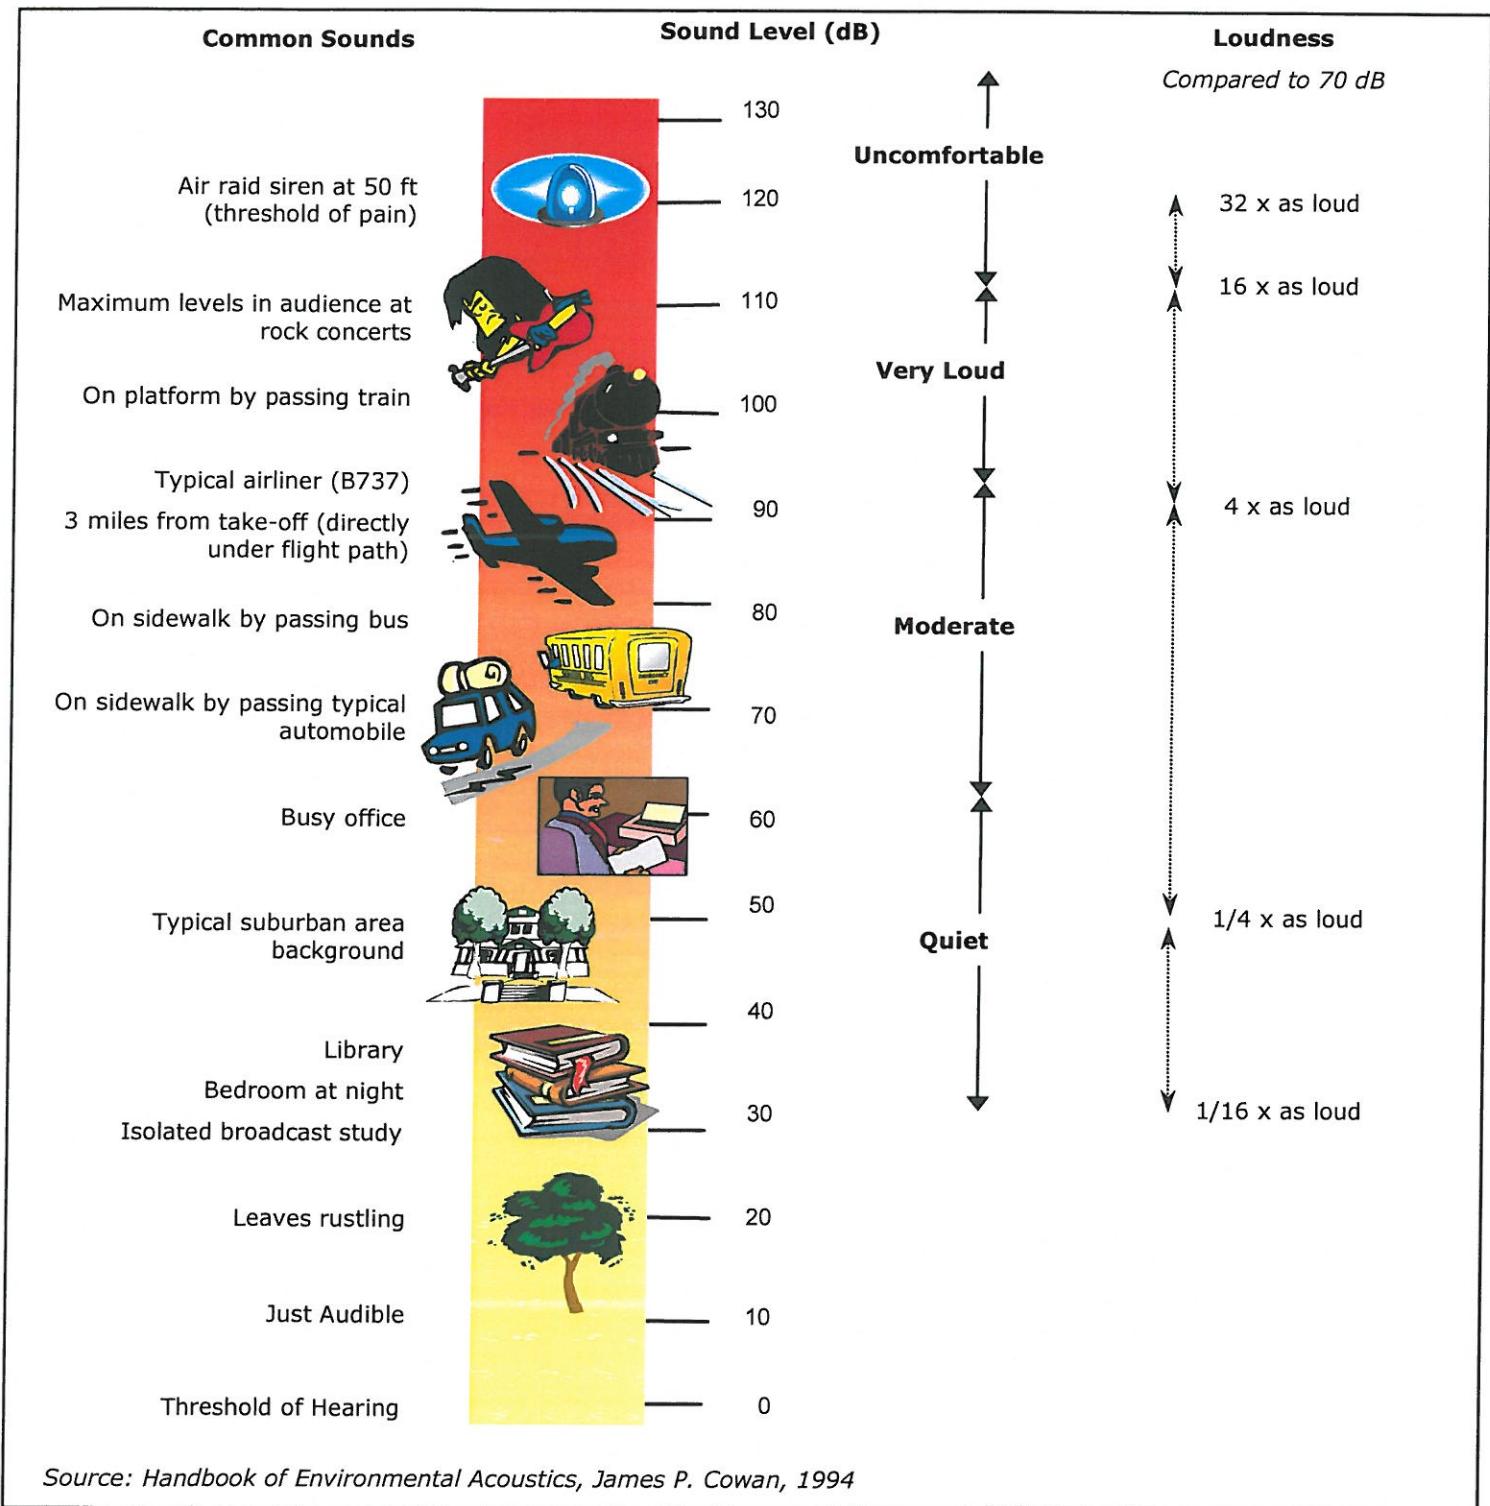

Phon = the unit of loudness on a scale beginning at zero for the faintest audible sound (0.00002 Pascals) and corresponding to the decibel scale of sound intensity with the number of phons of a given sound being equal to the decibels of a pure 1 kHz tone judged by the average listener to be equal in loudness to the given sound.

E-mail: audiobug1@aol.com

- 11) **auditory:** of, relating to, or experienced through the sense of hearing
- 12) **acoustic:** of or relating to the sense or organs of hearing, to sound, or to the science of sounds
- 13) **vibration:** a periodic motion of the particles of an elastic body or medium in alternately opposite directions from the position of equilibrium when that equilibrium has been disturbed (as when a stretched cord produces musical tones or particles of air transmit sounds to the ear)
- 14) **noise:**
 - 1 loud, confused, or senseless shouting or outcry
 - 2 a: SOUND; esp. : one that lacks agreeable musical quality or is noticeably unpleasant
b: any sound that is undesired or interferes with one's hearing of something
c: an unwanted signal or a disturbance (as static or a variation of voltage) in an electronic device or instrument (as radio or television); *broadly* : a disturbance interfering with the operation of a usu. mechanical device or system
 - d: electromagnetic radiation (as light or radio waves) that is composed of several frequencies and that involves random changes in frequency or amplitude
 - e: irrelevant or meaningless data or output occurring along with desired information

Re: 601 Washington Avenue –Traffic Study (April Update)

Dear Charlie:

Traf Tech Engineering, Inc. is pleased to provide you with the results of the updated traffic study undertaken for the proposed 601 Washington project planned to be located east side of Washington Avenue between 6th Street and 7th Street in the City of Miami Beach in Miami-Dade County, Florida. The revised study addresses the traffic comments provided by the City of Miami Beach's Transportation Consultant.

It has been a pleasure working with Imperial Companies on this project.

Sincerely,

TRAF TECH ENGINEERING, INC.

Joaquin E. Vargas, P.E.
Senior Transportation Engineer

INTRODUCTION

601 Washington is a proposed development planned to be located at 601 Washington Avenue in the City of Miami Beach in Miami-Dade County, Florida. The location of the project site is illustrated in Figure 1 on the following page.

Traf Tech Engineering, Inc. was retained by Imperial Companies to conduct a traffic study¹ in connection with the proposed project. The study addresses trip generation and the traffic impacts created by the proposed project on the nearby transportation network. This study is divided into seven (7) sections, as listed below:

1. Inventory
2. Existing Conditions
3. Traffic Counts
4. Trip Generation
5. Trip Distribution and Traffic Assignment
6. Traffic Impact Analysis
7. Conclusions and Recommendations

¹ The traffic methodology was discussed and agreed with the City of Miami Beach staff and is included in Appendix A

Traf Tech
ENGINEERING, INC.

PROJECT LOCATION MAP

FIGURE 1
601 Washington
Miami Beach, Florida

INVENTORY

Existing Land Use

The site is currently developed with commercial uses.

Proposed Land Uses and Access to Parking Garage

The proposed site will be re-developed with the following land uses and intensity:

- Retail – 55,425 square feet
- Hotel – 316 Rooms
- Restaurant – 472 seats

Access to the proposed parking structure will be provided via Collins Court (the alley located on the east side of the site). Appendix B contains a copy of the proposed site plan for the project site.

EXISTING CONDITIONS

This section addresses the existing roadway system located in the vicinity of the project site and nearby intersections.

Roadway System

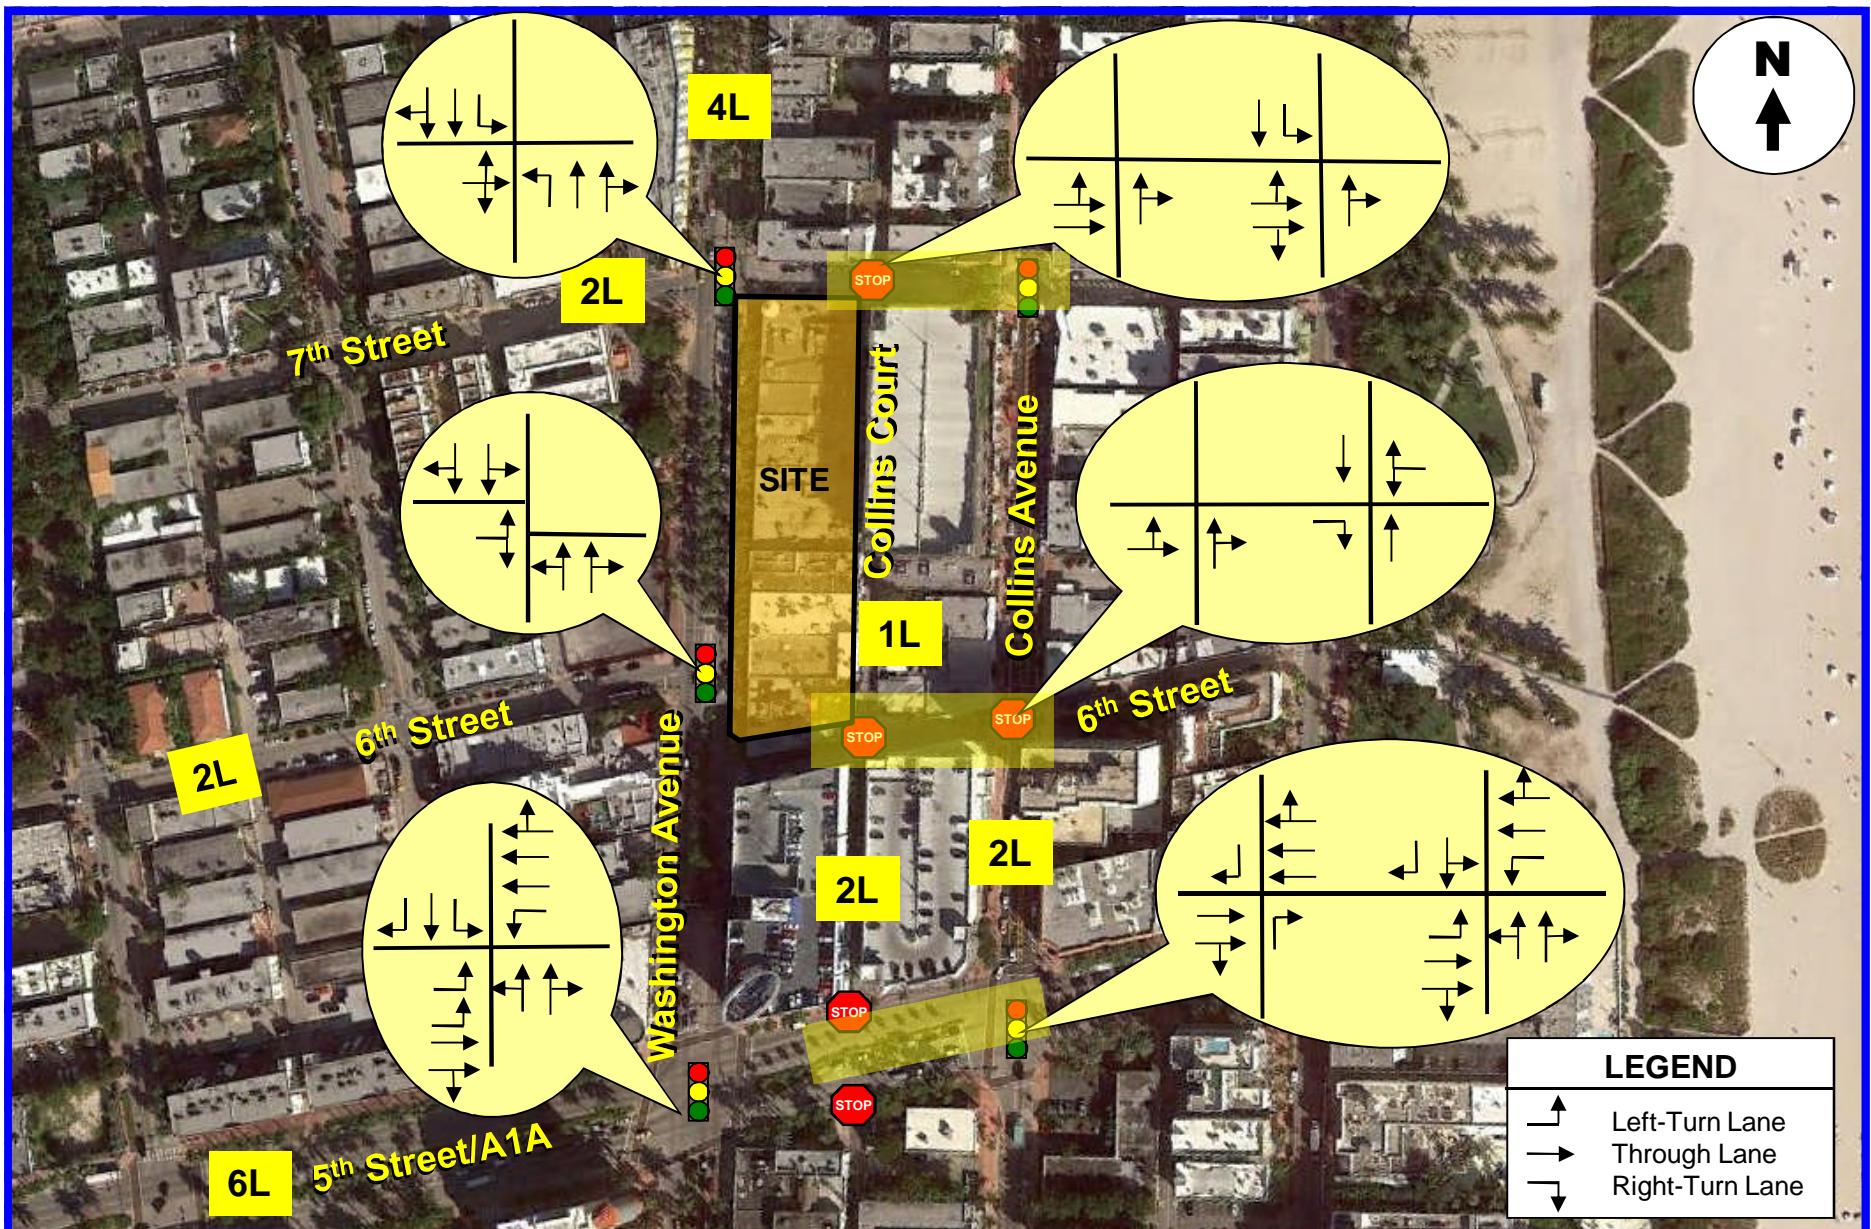

The roadway system located near the project site includes Collins Avenue, Washington Avenue, Collins Court, 5th Street/A1A, 6th Street, and 7th Street. Near the project site, Collins Avenue and Washington Avenue are two-lane and four-lane facilities in the north and south directions, respectively. Collins Court is a one-way, one-lane facility in the northbound direction between 6th Street and 7th Street. 5th Street/A1A is a six-lane facility in the east and west directions. 6th Street and 7th Street are one-way facilities in the east direction near the project site.

Nearby Intersections

With the assistance of City of Miami Beach staff, nine intersections/driveways were identified as the locations that will be impacted the most by the proposed project. These intersections/driveways include:

1. Collins Avenue and 5th Street/A1A (signalized)
2. Collins Avenue and 6th Street (stop controlled)
3. Collins Avenue and 7th Street (signalized)
4. Washington Avenue and 5th Street/A1A (signalized)
5. Washington Avenue and 6th Street (signalized)
6. Washington Avenue and 7th Street (signalized)
7. Collins Court and 5th Street/A1A (stop controlled)
8. Collins Court and 6th Street (stop controlled)
9. Collins Court and 7th Street (stop controlled)

Figure 2 shows the existing lane geometry of the nine intersections selected for analysis purposes. The number of lanes on the street system surrounding the project site is also depicted in the figure.

Traf Tech
ENGINEERING, INC.

EXISTING LANE GEOMETRY

FIGURE 2

Miami Beach, Florida

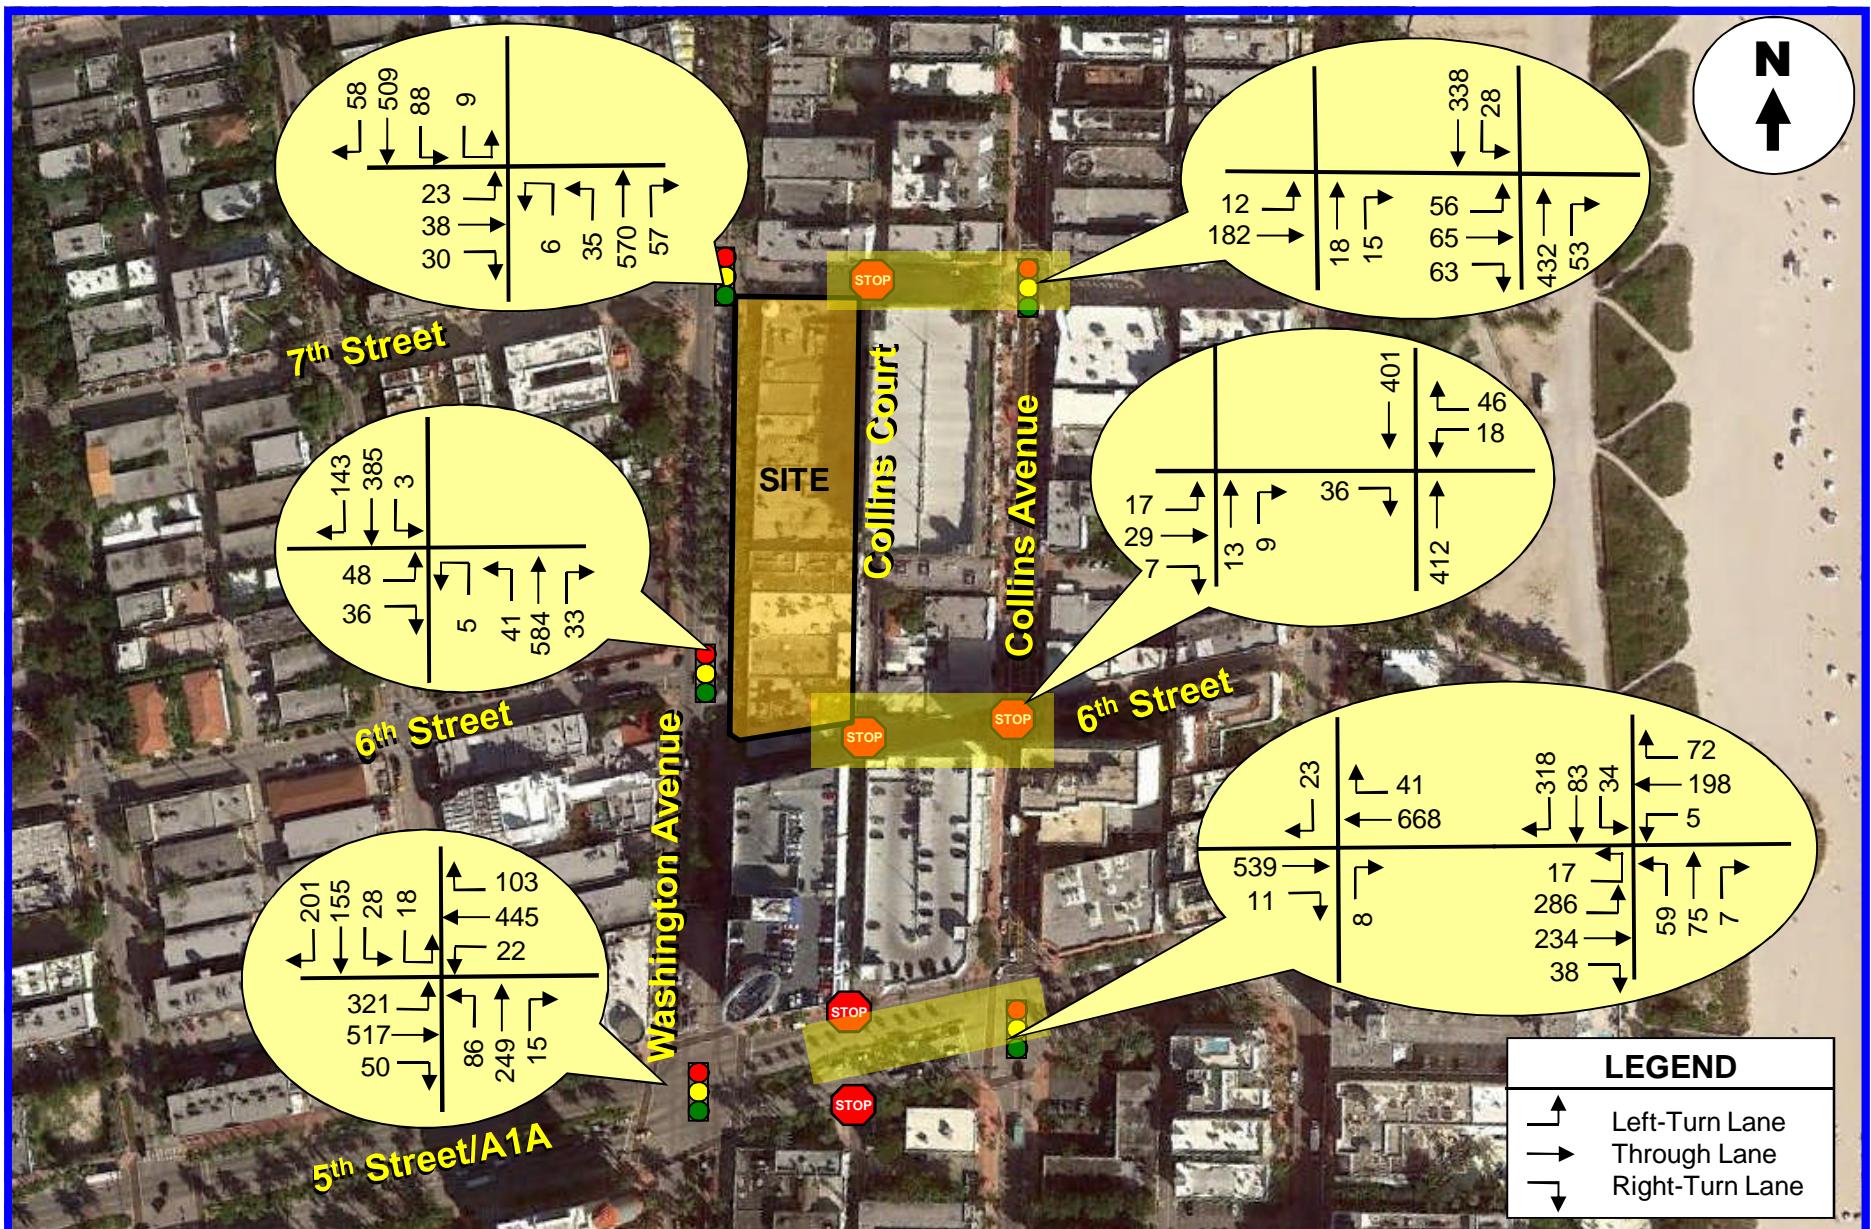

TRAFFIC COUNTS

Traf Tech Engineering, Inc., in association with Traffic Survey Specialists, Inc., collected traffic data at the following locations:

1. Collins Avenue and 5th Street/A1A (signalized)
2. Collins Avenue and 6th Street (stop controlled)
3. Collins Avenue and 7th Street (signalized)
4. Washington Avenue and 5th Street/A1A (signalized)
5. Washington Avenue and 6th Street (signalized)
6. Washington Avenue and 7th Street (signalized)
7. Collins Court and 5th Street/A1A (stop controlled)
8. Collins Court and 6th Street (stop controlled)
9. Collins Court and 7th Street (stop controlled)

The intersection turning movement counts performed by Traffic Survey Specialists, Inc., were collected on Friday, December 11, 2015 during the PM peak period (4:00 PM to 6:00 PM).

Figure 3 summarizes the results of the intersection turning movement counts undertaken during the weekday peak hour. Appendix C contains the intersection turning movement counts, as collected in the field. The signal timing plans were obtained from the Miami-Dade County's web site and are also contained in Appendix C.

Traf Tech
ENGINEERING, INC.

EXISTING TRAFFIC COUNTS – Peak Hour
(December 11, 2015)

FIGURE 3
601 Washington
Miami Beach, Florida

TRIP GENERATION

The trip generation for the project was based on information contained in the Institute of Transportation Engineer's (ITE) *Trip Generation Manual* (9th Edition). According to the subject ITE manual, the most appropriate "land use" category for the proposed land uses include Land Use 826 –Specialty Retail, Land Use 310 – Hotel, and Land Use 931 – Quality Restaurant. Table 1 summarizes the external trips associated with the proposed development.

TABLE 1 Trip Generation Summary (Proposed Uses) 601 Washington					
Land Use	Size	Daily Trips	PM Peak Hour		
			Total Trips	Inbound	Outbound
Retail (LUC 826)	55,425	2,409	155	68	87

Source: *ITE Trip Generation Manual* (9th Edition)

As indicated in Table 1, the external trips anticipated to be generated by the proposed 601 Washington project consist of approximately 6,173 daily trips and approximately 462 trips during the weekday peak hour (234 inbound and 228 outbound).

The trip generation rates used to determine the trips associated with the proposed use are presented below:

ITE Land Use 826 – Specialty Retail

Daily Trips

$$T = 42.78 (X) + 37.66$$

Where T = number of daily trips

X = 1,000 Square feet gross leasable area

PM Peak Hour of Adjacent Street (Typical Afternoon Peak Hour)

T = 2.40 (X) + 21.48 (44% inbound and 56% outbound)

Where T = number of PM peak hour trips

X = 1,000 Square feet gross leasable area

ITE Land Use 310 – Hotel

Daily Trips

T = 8.92 (X)

Where T = average daily vehicle trip ends

X = number of rooms on a weekday

PM Peak Hour of Adjacent Street (Typical Afternoon Peak Hour)

T = 0.70 (X) (49% inbound and 51% outbound)

Where T = average AM peak hour vehicle trip ends

X = number of rooms on a weekday

ITE Land Use 931 – Quality Restaurant

Weekday Daily Trip Generation

T = 2.86 (X)

Where T = number of weekday daily trips and

X = number of seats

PM Peak Hour of Adjacent Street (Typical Afternoon Peak Hour)

T = 0.26 (X) (67% inbound and 33% outbound)

Where T = number of weekday peak hour trips and

X = number of seats

TRIP DISTRIBUTION AND TRAFFIC ASSIGNMENT

The trip distribution and traffic assignment for the project were based on Miami-Dade County's Cardinal Distribution information for the study area. Table 2 summarizes the County's cardinal distribution data for Traffic Analysis Zone 655, which is applicable to the project site from the latest SERPM data published by Miami-Dade County.

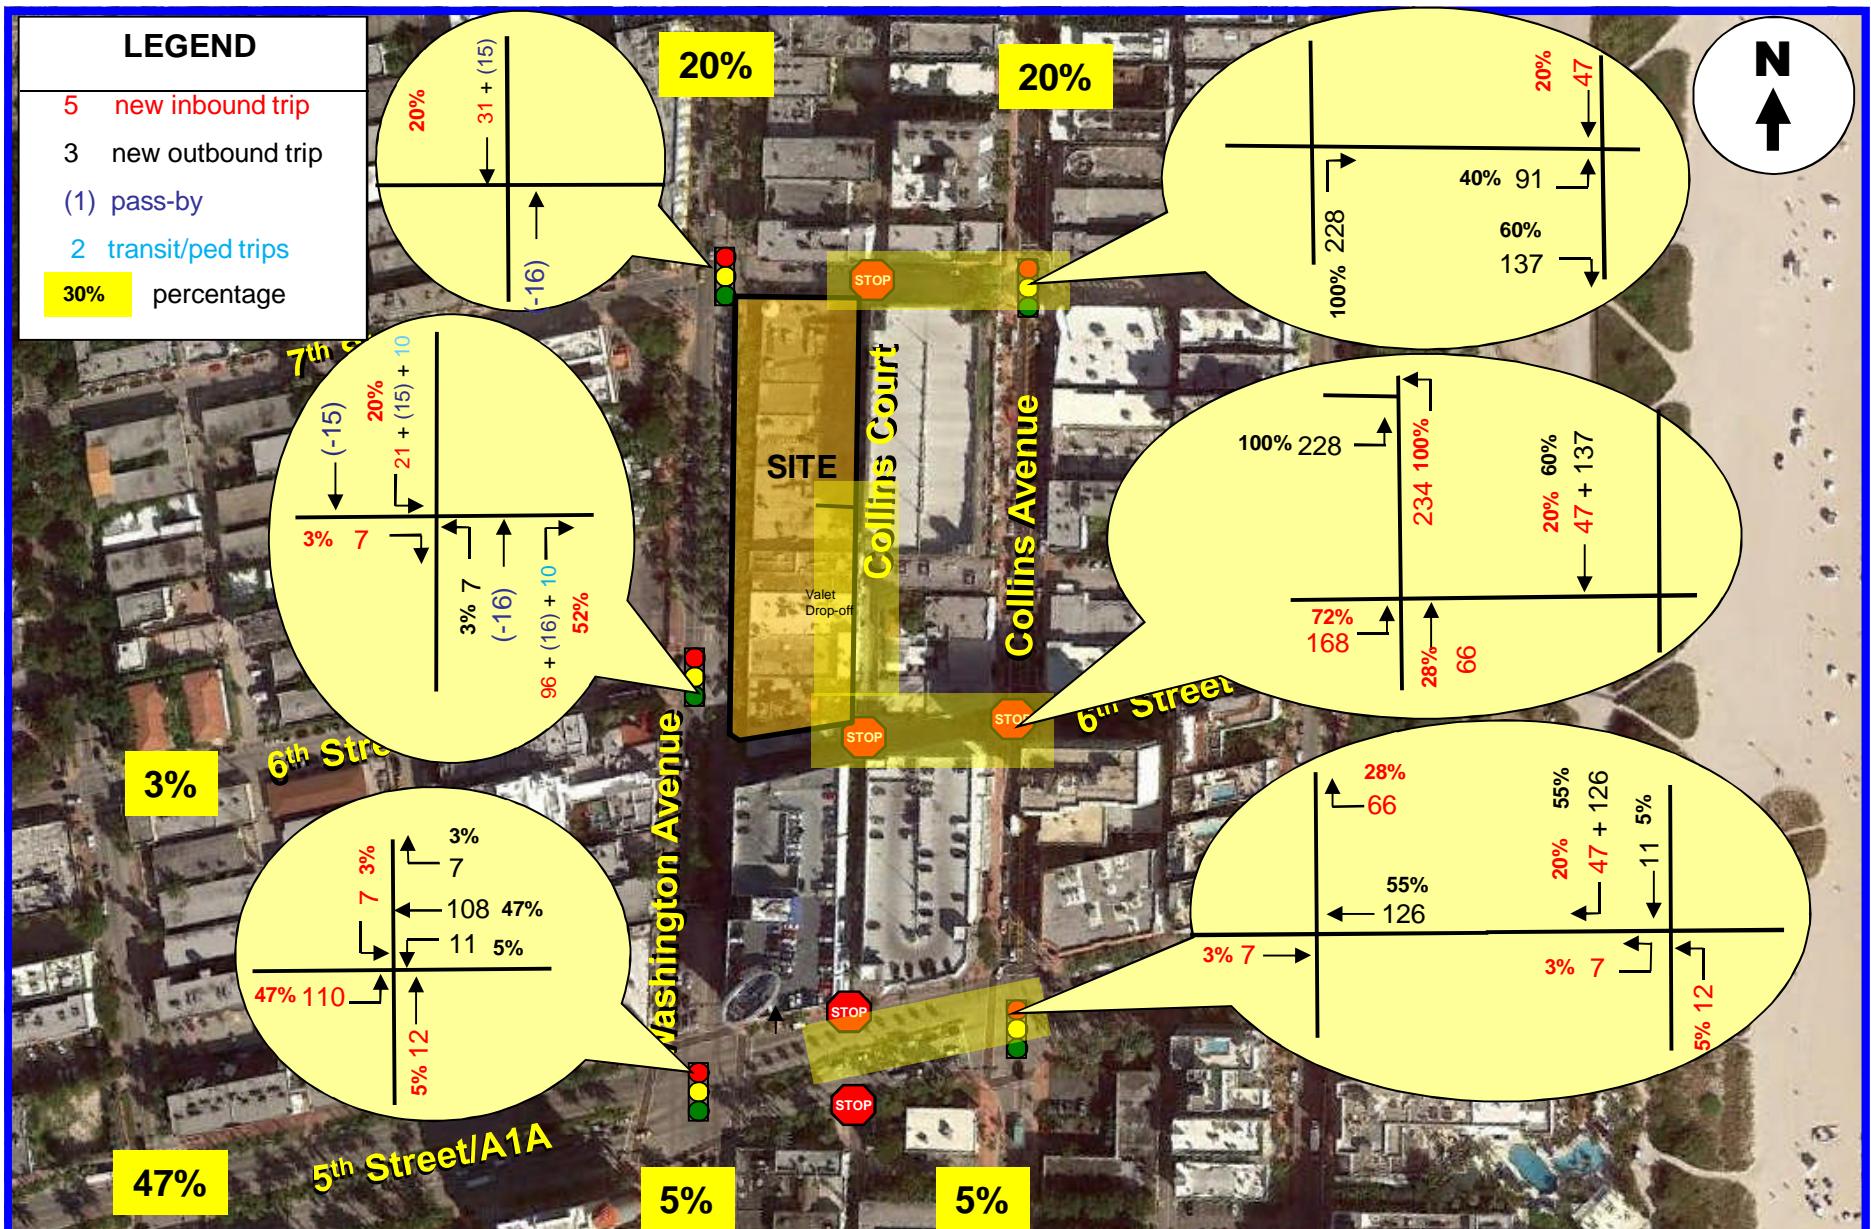

TABLE 2 Project Trip Distribution 601 Washington		
Direction		% of Total Trips
North:	Northwest	21.0
	Northeast	20.9
South:	Southwest	7.7
	Southeast	0.00
East:	Northeast	0.00
	Southeast	0.00
West:	Northwest	31.8
	Southwest	18.7
Total		100.00%

Source: Miami-Dade County (2040 SERPM)

Based on the above, the following traffic assignment was assumed for the proposed 601 Washington project:

- 20% to and from the north via Collins Avenue
- 5% to and from the south via Collins Avenue
- 20% to and from the north via Washington Avenue
- 5% to and from the south via Washington Avenue
- 3% to and from the west via 6th Street
- 47% to and from the west via 5th Street/A1A

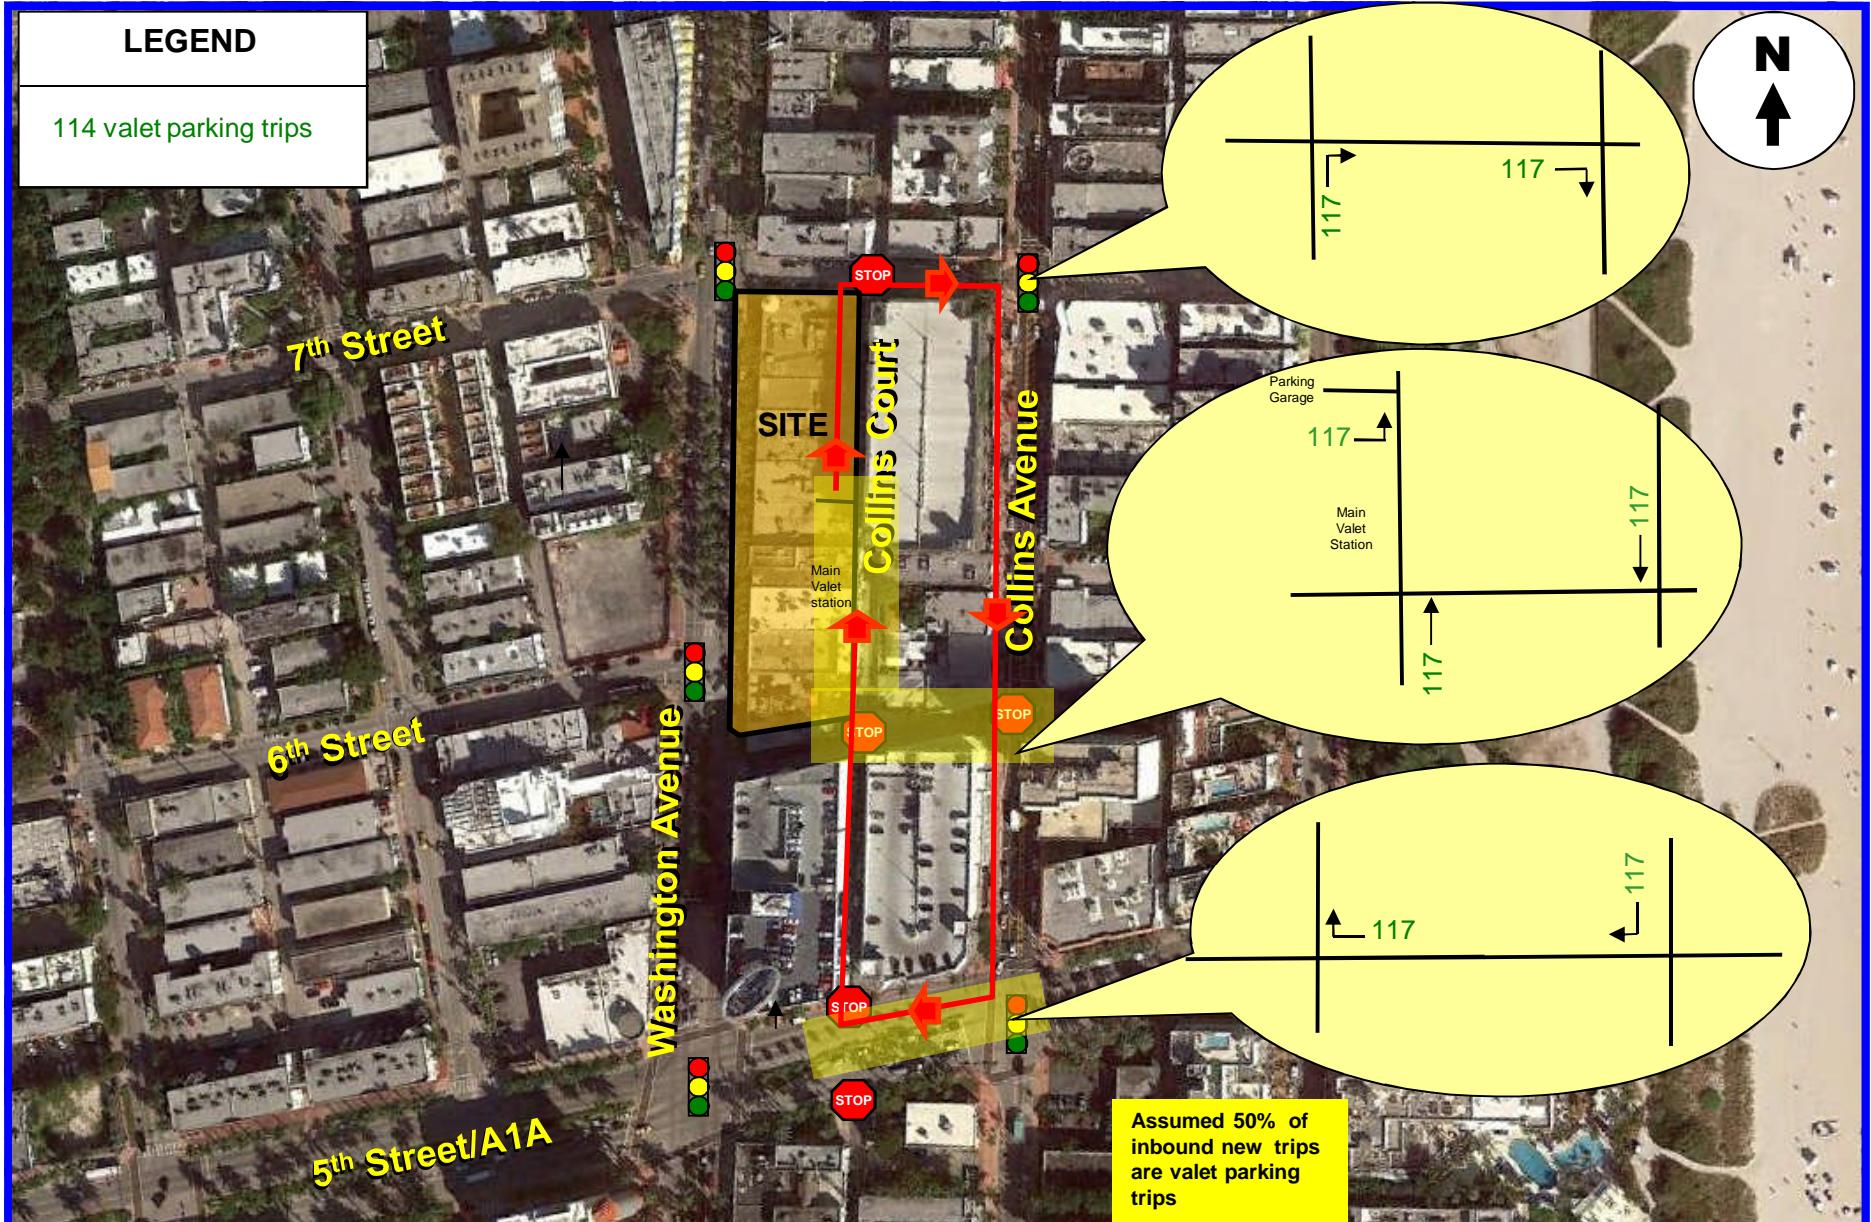

The new peak hour traffic generated by the project was assigned to the nearby transportation network using the traffic assignment documented above. The new project traffic assignment is summarized in Figures 4 and 4A.

TRAFFIC ANALYSIS

This section of the study is divided into four parts. The first part consists of developing the future conditions traffic volumes for the study area. The second part includes level-of-service analyses for existing and future conditions. The third section addresses the projected operating conditions of the project's access driveways. The final section focusses on valet parking.

Future Conditions Traffic Volumes

Two sets of future traffic volumes were developed. The first set includes project buildout conditions without the proposed project and the second set adds the new trips anticipated to be generated by the project.

In order to develop year 2018 traffic volumes (project anticipated to be built and occupied by the year 2018), without the proposed project, two separate analyses were undertaken. The first analysis converts the existing peak hour traffic counts collected in the field during the month of December to average peak season conditions. Based on FDOT's Peak Season Factor Category report, a factor of 1.05 is required to convert traffic counts collected in third week of December to average peak season conditions (refer to Appendix D). The second analysis includes a growth factor to project 2015 peak season traffic volumes to the year 2018. Based on traffic growth data published by the FDOT for a nearby traffic count stations, minimal traffic growth has occurred during the past five years (refer to Appendix D). However, in order to assess impacts with a conservative approach, and to account for unforeseen approved project (committed trips) that may impact the study intersections, a one percent (1.0%) growth rate was used for purposes of this study. Additionally, trips associated with future developments; The Anglers Hotel addition (660 Washington Avenue), The Torino (400 Collins Avenue) and, The Savoy Hotel were added to the background traffic. Committed development information is included in Appendix D.

The new trips generated by the 601 Washington project (refer to Figure 4) were added to the 2018 background traffic in order to develop total traffic conditions.

The future traffic projections for the study intersections (peak season adjustments, growth rates, committed developments and project traffic) are presented in tabular format in Appendix E. Figures 5 and 6 present the year 2018 future traffic volumes for the study area.

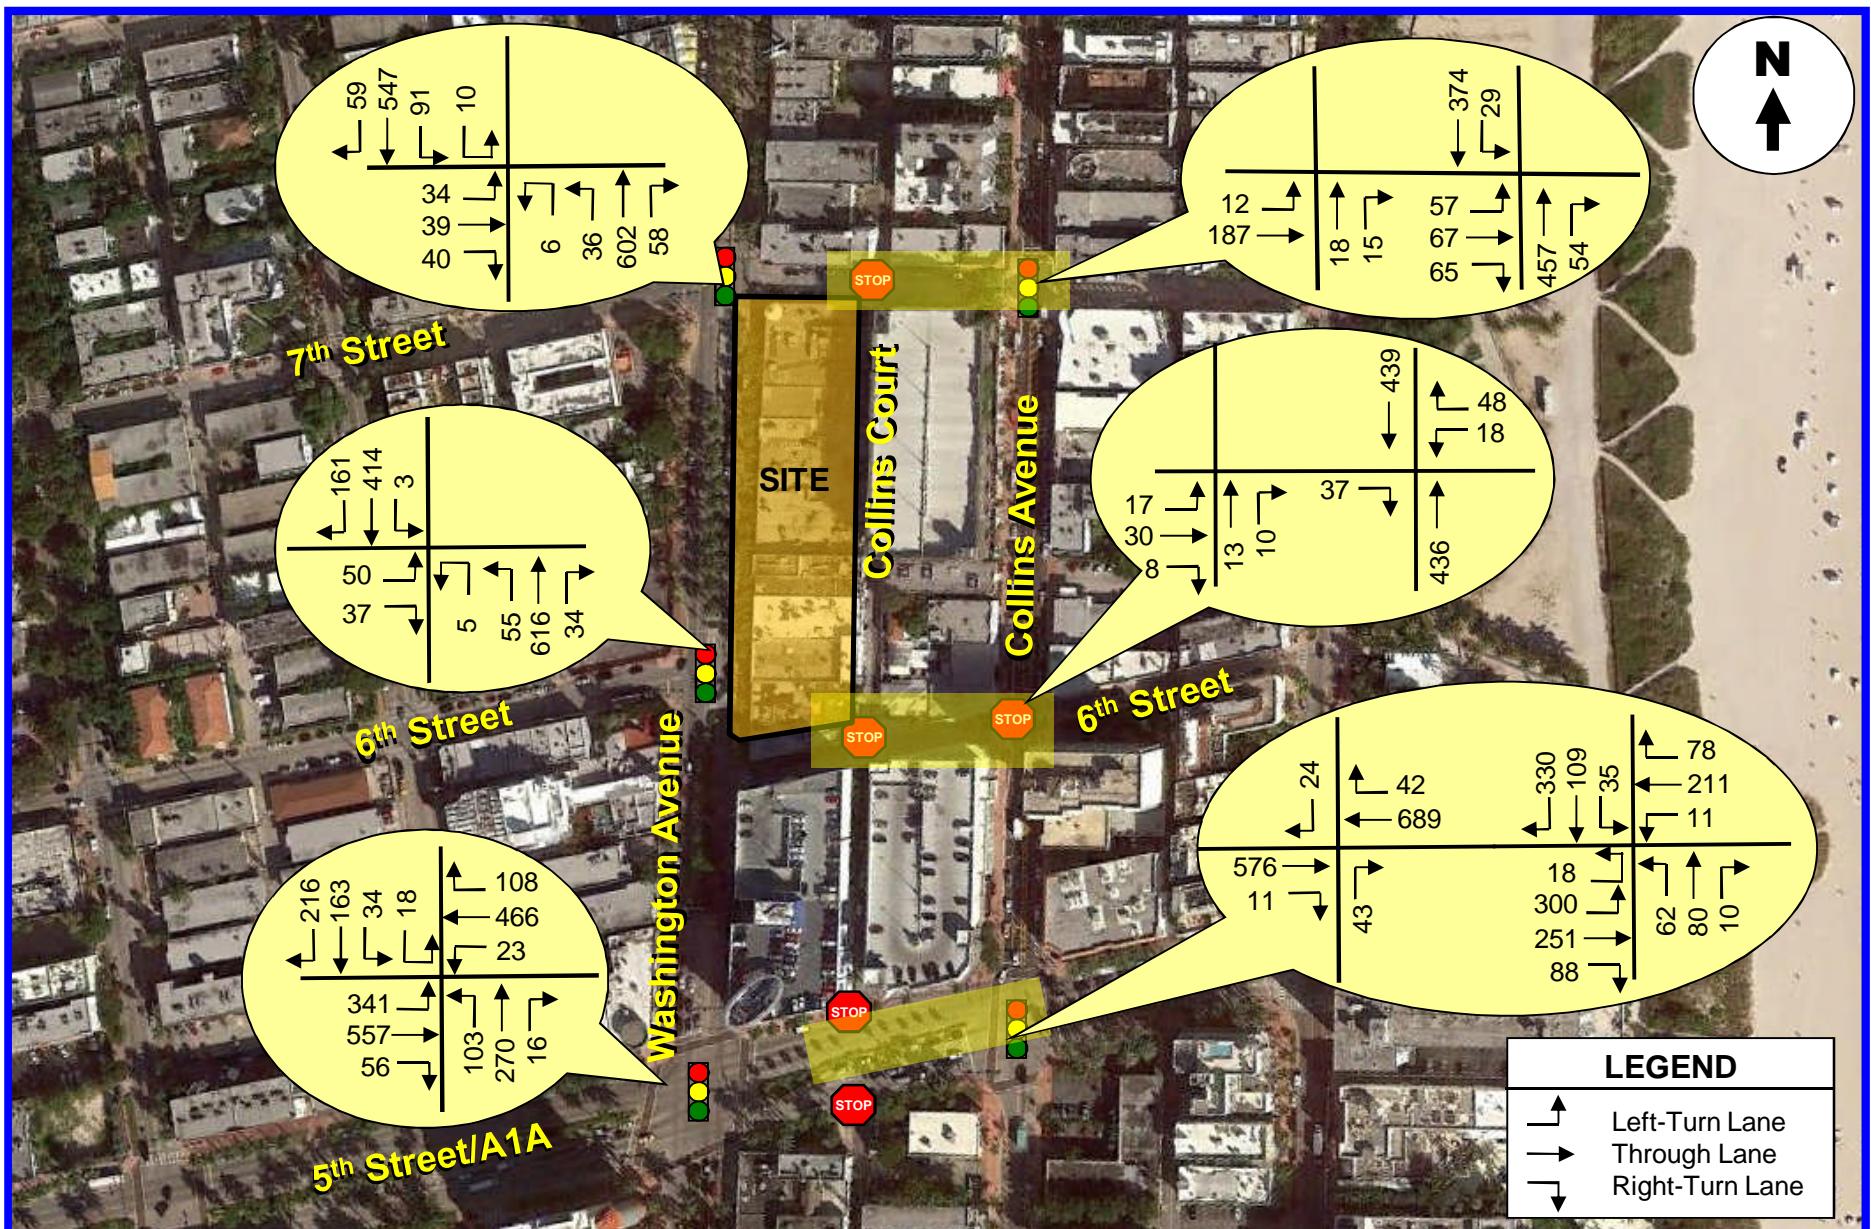

Figure 5 includes background traffic only (without the proposed project) and Figure 6 includes the additional traffic anticipated to be generated by the 601 Washington project.

Level of Service Analyses

Intersection capacity/level of service analyses were conducted for the nine study intersections. The analyses were undertaken following the capacity/level of service procedures outlined in the Highway Capacity Manual (HCS) using the SYNCHRO software. The results of the capacity analyses are summarized in Tables 3 and 4. As indicated in Tables 3 and 4, all study intersections are currently operating adequately and will continue to operate at an acceptable level of service in the year 2018 with the proposed project in place, with one exception (Collins Avenue and 5th Street). Note that the level of service at the intersection of Collins Avenue and 5th Street could be improved to LOS “D” by optimizing the intersection’s splits and offset.

Access Driveway

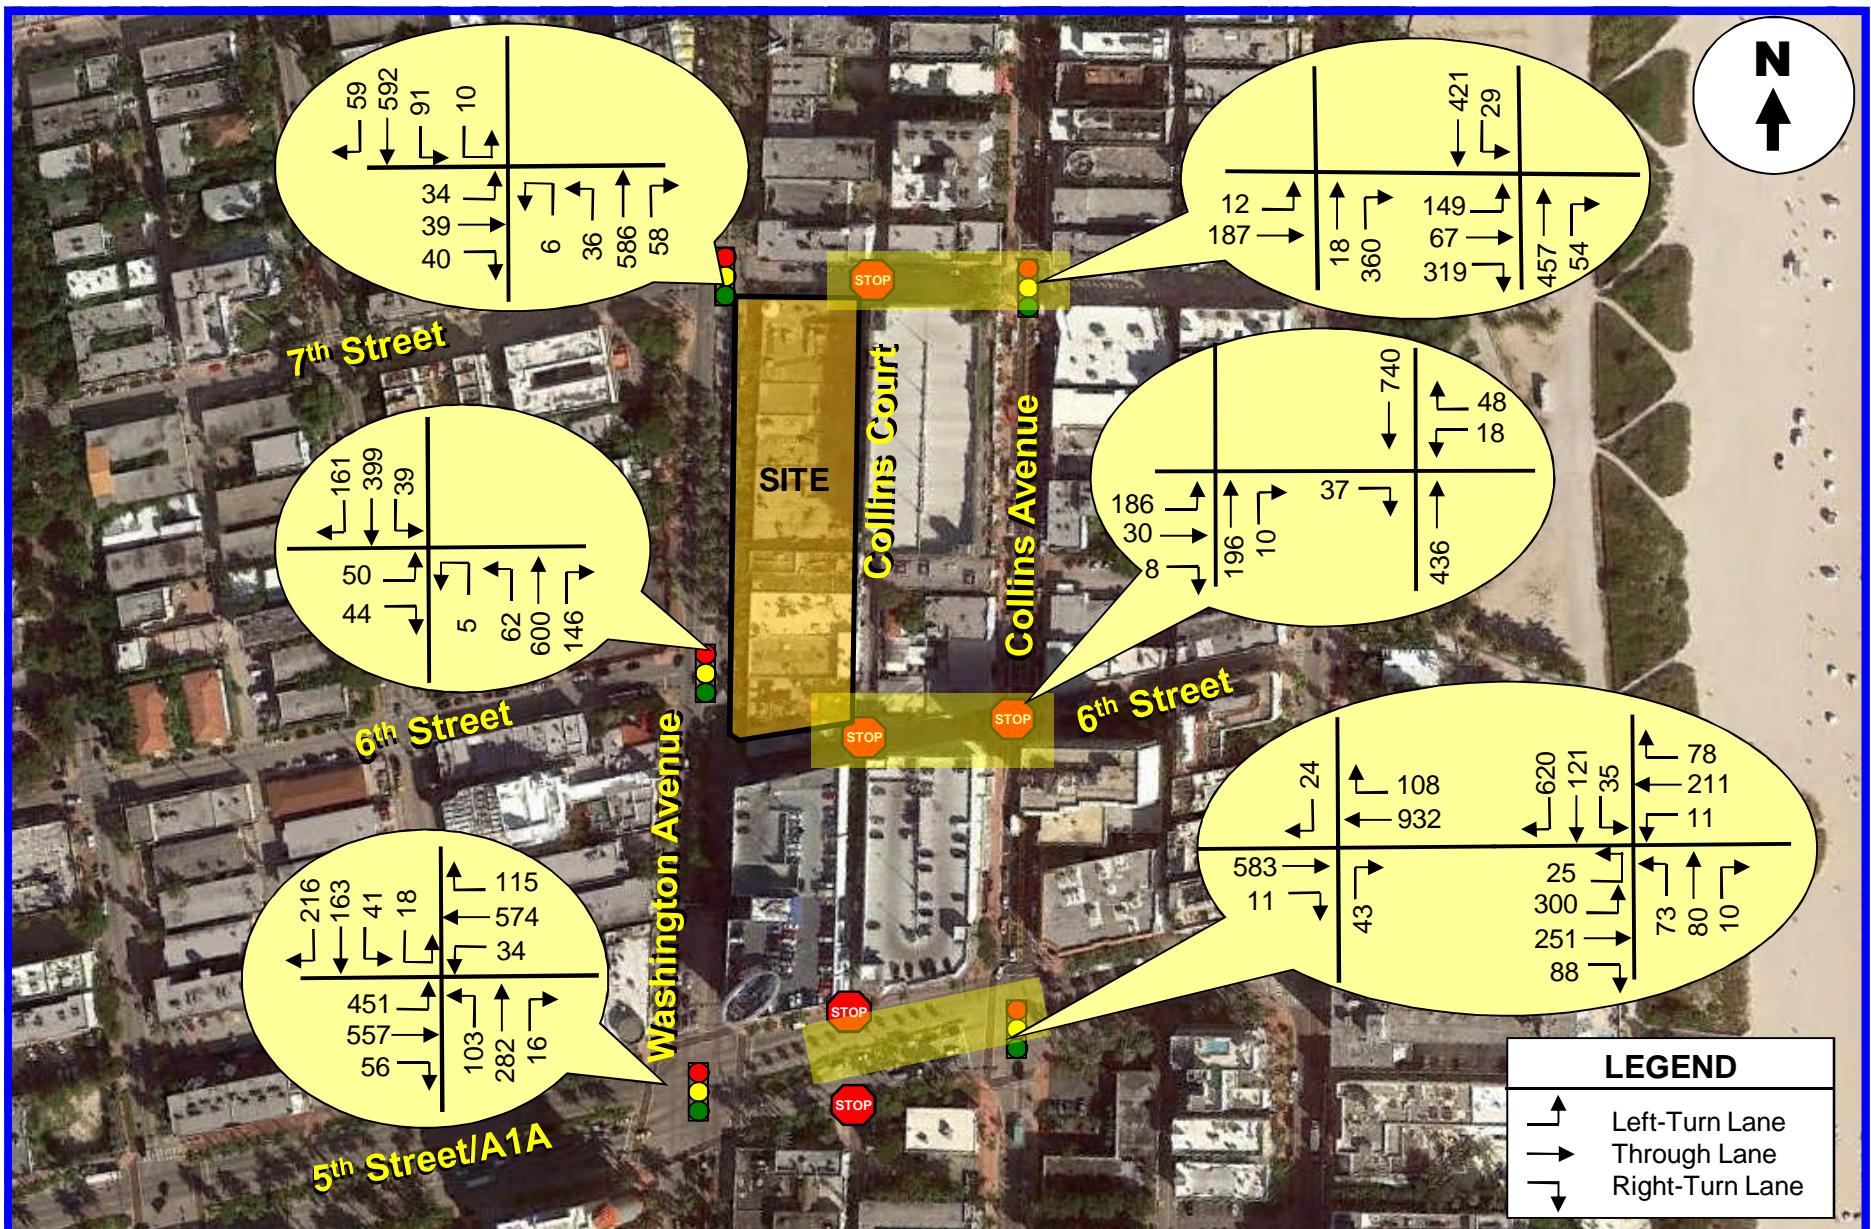

The project access driveway is projected to operate at level of service “B”

The computer printouts of the intersection capacity analyses are contained in Appendix F.

Valet Operation

The 601 Washington project will provide three (3) valet service areas. The valet areas on Washington Street and 7th Street are UBER drop-off and the valet area on Collins Court is the main valet drop-off/pick up area. All vehicles served by valet parking will stop at the valet station on Collins Court.

In order to determine the stacking requirements associated with the valet operation, a queuing analysis was undertaken. As indicated in Table 1, the maximum number of inbound vehicles associated with this project, during a one-hour period is approximately 234 vehicles.

A queuing analysis was conducted in order to ensure that the on-street stacking is sufficient to accommodate the maximum inbound vehicular demand anticipated at this facility. The length of queue anticipated on Collins Court was determined using information contained in ITE's *Transportation and Land Development*, Chapter 8 – Drive-In Facilities². For this analysis, the following input variables were used:

Service Rate: is the average time to park/unpark a vehicle by a valet runner. A weighted average service rate was determined based on the service rate for standard parking spaces and the service rate for tandem (mechanical lift) parking spaces. The average time by a valet runner is approximately 5 minutes, or 12 vehicles per hour per valet runner. Assuming up to 15 valet runners, the maximum service rate of the facility is 180 vehicles in a one-hour period.

Demand Rate: As indicated above, a maximum of 234 vehicles will arrive during the highest hour. Assuming 50% valet usage, the inbound vehicular traffic at the valet station is approximately 117 vehicles.

Using equation 8-9b and Table 8-11 of ITE's *Transportation and Land Development*, the maximum length of queue anticipated on Collins Court, at the 90% confidence level, is four (4) vehicles. Therefore, the valet station on Collins Court should provide parking for at least four (4) vehicles. The service rate calculations and results of the ITE queuing procedure are contained in Appendix G.²

² By Vergil G. Stover and Frank J. Koepke.

CONCLUSIONS AND RECOMMENDATIONS

601 Washington is a proposed re-development project planned to be located on the east side of Washington Avenue between 6th Street and 7th Street in the City of Miami Beach in Miami-Dade County, Florida. The project site currently consists of commercial uses. The proposed project will be developed with the following land uses and intensity:

- Retail – 55,425 square feet
- Hotel – 316 Rooms
- Restaurant – 472 seats

Access to the proposed parking garage will be provided via Collins Court.

Traf Tech Engineering, Inc. was retained by Imperial Companies to conduct a traffic study in connection with the 601 Washington project. The study addresses trip generation and the traffic impacts created by the proposed project on the nearby transportation network. The conclusions and recommendations of the traffic study are presented below:

- The external trips anticipated to be generated by the proposed 601 Washington project consist of approximately 6,173 daily trips and approximately 462 trips during the weekday peak hour (234 inbound and 228 outbound).

All study intersections are currently operating adequately and will continue to operate at an acceptable level of service in the year 2018 with the proposed project in place, with one exception (Collins Avenue and 5th Street). Note that the level of service at the intersection of Collins Avenue and 5th Street could be improved to LOS “D” by optimizing the intersection’s splits and offset.

-

-
- The project access driveway on Collins Court is projected to operate at level of service “B”.
 - The valet station on Collins Court should provide parking for at least four (4) vehicles.
 - Up to 15 valet runners should be assigned to this facility during the anticipated peak periods.

Transportation Demand Management (TDM)

There are numerous Transportation Demand Management (TDM) strategies to influence travel decision. Some improve the transportation options available; some provide incentives to change travel mode, time or destination; others improve land use accessibility; some involve transportation policy reforms and new programs that provide a foundation for TDM. Some benefits provided by a well-thought TDM program include:

- Congestion reduction
- Road and parking savings
- Transportation Options (choices)
- Road safety
- Environmental protection
- Improved quality of life
- Economic development
- Healthy lifestyles

The 601 Washington project proposes the following incentives in order to provide an effective TDM plan for the project:

Bicycling

Bicycle racks are being proposed at the site in order to encourage non-automobile modes of transportation.

Carpool

The proposed hotel will encourage employees to carpool. The hotel will provide a minimum of one (1) complimentary valet parking for High Occupancy Vehicle being used for Carpooling.

Transit Use

The hotel will have an informational kiosk within the lobby of the hotel with information relative to bus schedules and routes (two bus routes travel along Washington Avenue and two along nearby Collins Avenue) and the location of the two closest City Bike Station 123 and 124 near the intersection of 7th Street and Washington Avenue.

APPENDIX A

Traffic Methodology

TO: 601 Washington Avenue
FROM: Joaquin Vargas
DATE: January 10, 2016
SUBJECT: Traffic Methodology for 601 Washington

601 Washington is a proposed mixed-use development consisting of retail, hotel and restaurant uses including a parking garage.

The proposed mixed-use project will have a driveway into the parking garage off of the Collins Court. The following is our proposed methodology for the traffic study associated with this project:

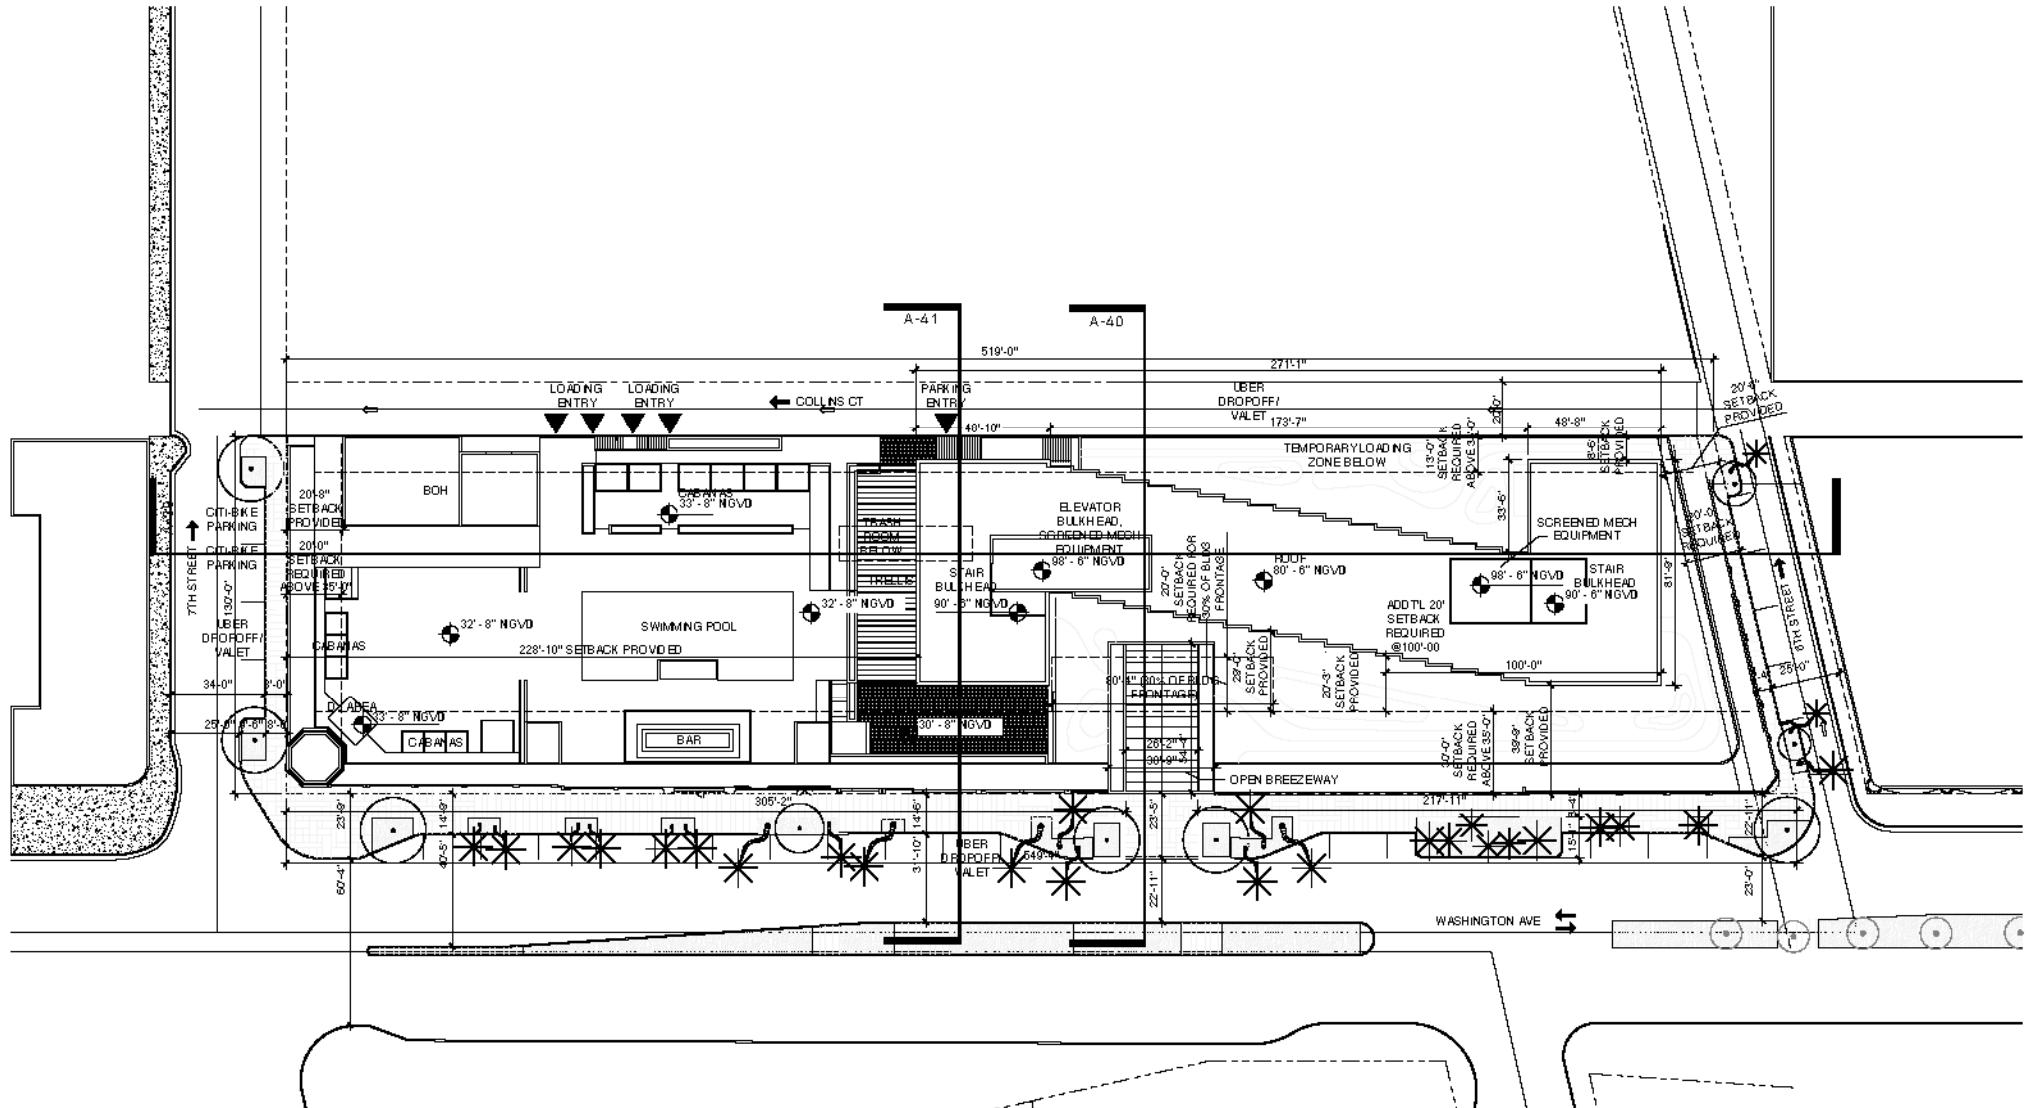

- The trip generation for the proposed facilities will be based on ITE's *Trip Generation Manual* (9th Edition). For the proposed restaurant seats, quality restaurant will be assumed (LUC 931). For the hotel use, LUC 310 will be used and for the retail LUC 826 (specialty retail), which is consistent with other commercial development within Miami Beach.
- The traffic study will evaluate nine (9) intersections in the immediate vicinity of the project. The analyses will be undertaken for the critical PM peak hour. These intersections are:
 1. Collins Avenue and 5th Street/A1A (signalized)
 2. Collins Avenue and 6th Street (stop controlled)
 3. Collins Avenue and 7th Street (signalized)
 4. Washington Avenue and 5th Street/A1A (signalized)
 5. Washington Avenue and 6th Street (signalized)
 6. Washington Avenue and 7th Street (signalized)
 7. Collins Court and 5th Street/A1A (stop controlled)
 8. Collins Court and 6th Street (stop controlled)
 9. Collins Court and 7th Street (stop controlled)
- Traffic circulation will be evaluated in the traffic study, including its impact to the surrounding street system and adjacent driveways, if any.
- The drop-off and pick-up lane will be evaluated from a queuing standpoint.
- For purposes of the traffic study, the build-out year will be 2017. For purposes of traffic growth, FDOT historical traffic data will be used.
- Existing traffic signal timing data and traffic counts will be included in the appendix of the traffic study.

- The traffic study will address any anticipated / proposed impacts onto the existing on-street vehicular parking, if applicable. Any impacts to on-street parking will be discussed with the City's Parking Department.
- Traffic figures will be prepared for the following trip generation scenarios for each of the intersections analyzed:
 1. Existing trips
 2. Proposed site trips distribution
 3. Existing + traffic growth
 4. Future or build-out + traffic growth + site trips
- The presence of transit and nearby routes will be discussed as will the provision and location of bicycle racks.
- Provide bicycle racks at the site to encourage other modes of transportation.
- The site plan will show the location of pick up/drop off for valet parking purposes.
- The site plan will also include the location of bicycle parking, garbage pick-up area and place designated for deliveries.
- The submittal of the study will include LOS calculations for review by the peer reviewer.

APPENDIX G

Queuing Analyses

Queuing Analysis based on ITE Procedures

$q = 117 \text{ veh/hr}$ (demand rate)

$Q = 12 \text{ veh/hr}$ (service rate)

$$p = \frac{q}{NQ} = 0.65 \quad (N = 15 \text{ valet runners})$$

$$Q_M = 0.65$$

Using Acceptable Probability of 10% (90% Confidence Level)

$$M = \left(\frac{\ln(x > M) - \ln(Q_M)}{\ln(p)} \right) - 1$$

$$M = \left(\frac{\ln(0.10) - \ln(0.65)}{\ln(0.65)} \right) - 1$$

$$M = \left(\frac{-2.3026 - (-0.4308)}{-0.4308} \right) - 1$$

$$M = 4.345 - 1 = 3.345, \text{ say } 4 \text{ vehicles}$$

Service Rate Calculation

An average service rate was determined based on the service rate for standard parking spaces and the service rate for mechanical lift parking spaces.

The total service rate for standard parking spaces is the sum of the following times:

- Walking time: time for valet attendant to pick up vehicle within the garage at walking speed of 6 feet per second.
- Driving time: time to drive around on local roads at a speed of 25 miles per hour.

The total service rate for mechanical lift parking includes the same time processing times as for standard parking and also includes:

- Mechanical lift processing time: time for mechanical lift to descend from the most suspended position, load car and ascend for half of the lift space.

Valet Time (Standard Parking Spaces):

- Walking Time: $260 \text{ ft} * (1 \text{ sec}/6\text{ft}) * (1 \text{ min}/60\text{sec}) = 0.72 \text{ min}$
- Driving Time + Control Delay: $2,164.8 \text{ ft } * (1\text{mile}/5,280) * (1\text{hr}/25 \text{ miles}) * (60 \text{ min}/1\text{hr}) + 181.3 \text{ sec} * (1 \text{ min}/60 \text{ sec}) = 4.00$
- Total Time: 4.72 min

Valet Time (Lift Parking Spaces):

- Walking Time: $260 \text{ ft} * (1 \text{ sec}/6\text{ft}) * (1 \text{ min}/60\text{sec}) = 0.72 \text{ min}$
- Driving Time + Control Delay: $2,164.8 \text{ ft } * (1\text{mile}/5,280) * (1\text{hr}/25 \text{ miles}) * (60 \text{ min}/1\text{hr}) + 181.3 \text{ sec} * (1 \text{ min}/60 \text{ sec}) = 4.00$
- Lift Processing Time: $1 \text{ lift } * (30 \text{ sec/lift}) * (1 \text{ min}/60\text{sec}) = 0.50 \text{ min}$
- Total Time: 5.22 min

Average Valet Time:

$$(4.72 + 5.22)/2 = \mathbf{4.97 \text{ min, say 5 min}}$$
