**Re: 1575 Alton Road
Traffic Assessment
Miami Beach, Florida**

Dear Mr. Akcay:

Kimley-Horn and Associates, Inc. has performed a traffic assessment for the proposed redevelopment located at 1575 Alton Road in Miami Beach, Florida. The site proposed for redevelopment is currently occupied by a 11,849 square-foot automobile service and tire shop. The proposed redevelopment includes a 102-seat restaurant, 207-seat restaurant, and 770 square-foot bakery. Note the existing automobile service and tire shop is not currently operational and will be demolished as part of the proposed redevelopment. Note that no self-parking will be provided on-site. Therefore, all vehicular traffic with the exception of taxi/rideshare vehicles will be valeted. A project location map and site plan are included in Attachment A-1. The traffic assessment is consistent with the requirements outlined by the City of Miami Beach. Note that a complete traffic study with the remaining required analyses will be prepared as part of the response to City comments. Methodology correspondence is included in Attachment B-1. The traffic assessment includes a trip generation analysis, trip distribution and assignment, multimodal evaluation, site loading operations plan, transportation demand management (TDM) strategies, valet analysis, and capacity analysis. The following sections summarize the analysis.

TRIP GENERATION

Trip generation calculations for the proposed redevelopment were performed using Institute of Transportation Engineers' (ITE) *Trip Generation Manual*, 10th Edition. The trip generation for the proposed redevelopment was determined using ITE LUC 931 (Quality Restaurant) and 939 (Bread/Donut/Bagel Shop without Drive-Through Window).

A multimodal (public transit, bicycle, and pedestrian) factor based on US Census *Means of Transportation to Work* data was reviewed for the census tracts in the vicinity of the site. The US Census data indicated that there is a 50.2 percent (50.2%) multimodal factor within the vicinity of the site. However, to provide a conservative analysis, a multimodal factor of 20.0 percent (20.0%) was applied to the trip generation calculations to account for the urban environment in which the project site is located. It is expected that a portion of employees, guests, and patrons will choose to walk, bike, or use public transit to and from the site. Miami-Dade Transit (MDT) and the City of Miami Beach provide transit service within the vicinity of the proposed redevelopment via the following routes:

- MDT Route 113/M provides transit service along Alton Road within the vicinity of the proposed redevelopment with approximately 60-minute headways during the weekday P.M. peak hour and weekend peak hour.

- MDT Route 119/S provides transit service along Alton Road within the vicinity of the proposed redevelopment with approximately 12-minute headways during the weekday P.M. peak hour and approximately 15-minute headways during the weekend peak hour.
- City of Miami Beach South Beach Loop provides transit service along Alton Road within the vicinity of the proposed redevelopment with approximately 20-minute headways during the weekday P.M. peak hour and weekend peak hour.

Pass-by capture trip rates were determined based on average rates provided in the ITE's *Trip Generation Handbook*, 3rd Edition. The average pass-by rate for the restaurant land use is 44.0 percent (44.0%) during the weekday P.M. peak hour.

The project is expected to generate 48 net new vehicle trips during the A.M. peak hour, 57 net new vehicle trips during the P.M. peak hour, and 112 net new vehicle trips during the weekend (Saturday) peak hour of generator. Detailed trip generation calculations and transit information are included as Attachment C-1.

TRIP DISTRIBUTION AND ASSIGNMENT

The trip distribution was based on an interpolated cardinal trip distribution for the project site's traffic analysis zone (TAZ) obtained from the Miami-Dade Transportation Planning Organization's (TPO's) 2045 *Long Range Transportation Plan Directional Trip Distribution Report*. The trip distribution for the anticipated build-out year of 2022 was interpolated from the 2015 and 2045 data. The project is located within TAZ 642. The cardinal distribution is shown in Table 1. The detailed cardinal distribution is provided in Attachment D-1.

Table 1: Cardinal Trip Distribution	
Cardinal Direction	Percentage of Trips
North-Northeast	16.0%
East-Northeast	11.0%
East-Southeast	1.0%
South-Southeast	10.0%
South-Southwest	4.0%
West-Southwest	26.0%
West-Northwest	18.0%
North-Northwest	14.0%
Total	100.0%

MULTIMODAL EVALUATION

Existing and programmed bicycle and pedestrian amenities were evaluated along Alton Road between 15th Street and Lincoln Road, along 16th Street between West Avenue and Lenox Avenue, and at the intersection of Alton Road at 16th Street. A detailed evaluation of bicycle and pedestrian amenities is provided below:

Alton Road between 15th Street and Lincoln Road

Alton Road between 15th Street and Lincoln Road functions as a four-lane, divided roadway with on-street parking located along the east and west sides of the roadway. Sidewalk widths vary from approximately 11 feet to 16 feet along the east side of the roadway and from approximately five (5) feet to 16 feet along the west side of the roadway. Additionally, sharrows are provided in the northbound and southbound directions.

16th Street between West Avenue and Lenox Avenue

16th Street between West Avenue and Lenox Avenue functions as a two-lane, undivided roadway with on-street parking located along the north and south sides of the roadway. Sidewalk widths vary from approximately five (5) feet to nine (9) feet along the north and south sides of the roadway. Additionally, dedicated bicycle lanes are provided in the eastbound and westbound directions. Note that the dedicated bicycle lanes along the north and south sides of 16th Street east of Alton Road are provided with green colored pavement. Further note that based on the *FY 2020 – 2024 Capital Budget and 5-Year Capital Improvement Plan*, protected bicycle lanes will be implemented along 16th Street between Washington Avenue and Bay Road as part of the *Flamingo Park Neighborhood Right-of-Way Improvement Project*.

Alton Road and 16th Street Intersection

The intersection of Alton Road and 16th Street operates under signal control and is located at the northwest corner of the proposed redevelopment. Special emphasis crosswalks and pedestrian signalization is provided at all the intersection approaches. Pedestrian signal push-button detection is provided the north and south leg crosswalks on 16th Street. Additionally, pedestrian ramps with truncated domes are provided at all corners of the intersection.

SITE LOADING OPERATIONS PLAN

Loading operations for deliveries and sanitation vehicles will be conducted within the existing one-way, northbound alley located along the east side of the proposed redevelopment. Loading vehicles will enter the alley along 15th Street and exit the alley along 16th Street. As all loading activities will occur within the alley, loading vehicles will not impact the external roadway network.

TRANSPORTATION DEMAND MANAGEMENT STRATEGIES

Transportation Demand Management (TDM) strategies are proposed to reduce the impacts of the project traffic on the surrounding roadway network. Typical measures promote bicycling and walking, encourage car/vanpooling and offer alternatives to the typical workday hours. The applicant will commit to providing the following incentives including:

- Providing transit information within the site including route schedules and maps
- Providing secure bicycle parking (bicycle racks and lockers)

The applicant intends to make the site bicycle/pedestrian- and transit-friendly.

VALET SERVICE AND OPERATIONS ANALYSIS

The proposed redevelopment will be served by one (1) drop-off/pick-up area for valet operations. A valet operations queuing analysis was prepared for two (2) scenarios: i.) vehicle drop-off/pick-up area

located along the south/eastbound side of 16th Street just east of Alton Road and ii.) vehicle drop-off/pick-up area located along the east/northbound side of Alton Road just south of 16th Street. All vehicular traffic with the exception of taxi/rideshare vehicles will be valeted. The drop-off/pick-up areas will provide vehicle storage for approximately four (4) vehicles. It was assumed that three (3) spaces will be utilized for valet operations and one (1) space will be utilized for taxi/rideshare drop-off/pick-up. It is anticipated that all valet vehicles will be parked at the proposed 1212 Lincoln Road parking garage.

Valet Assumptions

The queuing analysis used the multiple-channel waiting line model with Poisson arrivals and exponential service times. The queuing analysis is based on the coefficient of utilization, ρ , which is the ratio of the average vehicle arrival rate over the average service rate multiplied by the number of channels.

If the coefficient of utilization (average service rate/valet attendant service capacity) is greater than one (>1), the calculation methodology does not yield a finite queue length. This result indicates overcapacity conditions for the valet area. The valet attendant service capacity is the number of total trips a valet attendant can make in a one-hour period multiplied by the number of valet attendants.

The analysis determined the required queue storage, M , which is exceeded P percent of the time. This analysis seeks to ensure that the queue length does not exceed the storage provided at a level of confidence of 95.0 percent (95.0%).

An iterative approach was used to determine the number of valet attendants required to accommodate the proposed redevelopment demand during the analysis hour and ensure that the 95th percentile valet queue does not extend beyond the designated valet service area.

The valet queuing operations analysis was performed based on the methodology outlined in ITE's *Transportation and Land Development*, 1988. The analysis was performed to determine if valet operations could accommodate vehicular queues without blocking travel lanes on either 16th Street or Alton Road. Valet operations were analyzed for the number of valet attendants and required vehicle stacking for the proposed redevelopment.

The valet analysis was prepared for the weekend (Saturday) peak hour of generator as it is the highest demand condition. The proposed redevelopment is expected to generate 112 vehicle trips during the weekend (Saturday) peak hour of generator. Please note that a 42.6 percent (42.6%) taxi/rideshare factor was applied to the trip generation estimates based on actual field observations from the Cadillac Hotel located at 3925 Collins Avenue to account for taxi/rideshare trips. Therefore, the project is expected to generate 64 valet trips during the weekend (Saturday) peak hour of generator.

16th Street Drop-off/Pick-up Area Valet Analysis

Valet drop-off vehicles will exit the valet drop-off/pick-up area, travel eastbound along 16th Street, southbound along Lenox Avenue, westbound along 15th Street, northbound along Alton Road, westbound along 16th Street and enter the 1212 Lincoln Road parking garage. To provide a conservative analysis, valet processing time to the 6th level of the parking garage was used. Note that it was assumed that the parking garage occupies levels 3 to 6. Valet pick-up vehicles will exit the

parking garage, travel eastbound along 16th Street and enter the valet drop-off/pick-up area. A graphic illustration of the proposed valet routes to and from the parking garage is provided in Attachment G-1.

Valet attendants will be stationed at the on-site valet drop-off/pick-up area. Valet drop-off trip service time was calculated based on the time it would take a valet parking attendant to obtain and park a drop-off vehicle in the 1212 Lincoln Road parking garage and return to the valet station. Valet pick-up trip service time was calculated based on the time it would take a valet parking attendant to bring a parked vehicle back to a patron at the on-site valet drop-off/pick-up area for pick-up. The following summarizes the total valet drop-off and pick-up service times.

The service time for valet drop-off operation corresponds to the following:

- Exchange between valet attendant and driver (0.5 minutes)
- Valet attendant drives vehicle from drop-off/pick-up area to parking garage (4.4 minutes)
- Valet attendant returns to valet station (2.3 minutes)
- Total service rate: 7.2 minutes

The service time for valet pick-off operation corresponds to the following:

- Valet attendant proceeds to the parking garage to retrieve the vehicle (2.3 minutes)
- Valet attendant drives vehicle from parking garage to the drop-off/pick-up area (2.7 minutes)
- Exchange between valet attendant and driver (0.5 minutes)
- Total service rate: 5.5 minutes

The calculated average service time for vehicles valeted from the on-site drop-off/pick-up area is 7.2 minutes for valet drop-off and 5.5 minutes for valet pick-up. Processing times include the time for the exchange between the driver and valet attendants. Detailed travel time calculations are included in Attachment E-1.

Results of the highest demand condition valet operations analysis demonstrate that a maximum of ten (10) valet attendants would be required so that the vehicle drop-off/pick-up storage would not be exceeded. It should be noted that projected vehicular volumes and estimated valet processing times were conservatively assumed in the analysis. If it is determined that valet processing times can be performed more efficiently, and/or actual traffic volumes are lower than projected, a reduced number of valet attendants may be adequate to serve the site. Detailed valet analysis calculation worksheets are provided in Attachment E-1.

Alton Road Drop-off/Pick-up Area Valet Analysis

Valet drop-off vehicles will exit the valet drop-off/pick-up area, travel northbound along Alton Road, eastbound along 16th Street, southbound along Lenox Avenue, westbound along 15th Street, northbound along Alton Road, westbound along 16th Street and enter the 1212 Lincoln Road parking garage. To provide a conservative analysis, valet processing time to the 6th level of the parking garage was used. Note that it was assumed that the parking garage occupies levels 3 to 6. Valet pick-up vehicles will exit the parking garage, travel eastbound along 16th Street, southbound along Lenox Avenue, westbound along 15th Street, northbound along Alton Road, and enter the valet drop-off/pick-up area.

Valet attendants will be stationed at the on-site valet drop-off/pick-up area. Valet drop-off trip service time was calculated based on the time it would take a valet parking attendant to obtain and park a drop-off vehicle in the 1212 Lincoln Road parking garage and return to the valet station. Valet pick-up trip service time was calculated based on the time it would take a valet parking attendant to bring a parked vehicle back to a patron at the on-site valet drop-off/pick-up area for pick-up. The following summarizes the total valet drop-off and pick-up service times.

The service time for valet drop-off operation corresponds to the following:

- Exchange between valet attendant and driver (0.5 minutes)
- Valet attendant drives vehicle from drop-off/pick-up area to parking garage (5.1 minutes)
- Valet attendant returns to valet station (2.7 minutes)
- Total service rate: 8.3 minutes

The service time for valet pick-off operation corresponds to the following:

- Valet attendant proceeds to the parking garage to retrieve the vehicle (2.7 minutes)
- Valet attendant drives vehicle from parking garage to the drop-off/pick-up area (4.3 minutes)
- Exchange between valet attendant and driver (0.5 minutes)
- Total service rate: 7.5 minutes

The calculated average service time for vehicles valeted from the on-site drop-off/pick-up area is 8.3 minutes for valet drop-off and 7.5 minutes for valet pick-up. Processing times include the time for the exchange between the driver and valet attendants. Detailed travel time calculations are included in Attachment E-1.

Results of the highest demand condition valet operations analysis demonstrate that a maximum of 12 valet attendants would be required so that the vehicle drop-off/pick-up storage would not be exceeded. It should be noted that projected vehicular volumes and estimated valet processing times were conservatively assumed in the analysis. If it is determined that valet processing times can be performed more efficiently, and/or actual traffic volumes are lower than projected, a reduced number of valet attendants may be adequate to serve the site. Detailed valet analysis calculation worksheets are provided in Attachment E-1.

INTERSECTION CAPACITY ANALYSIS

Existing Traffic

Existing turning movement count data were provided by the City of Miami Beach for the intersection of SR 907/Alton Road at 16th Street. Traffic data were collected on Thursday, January 23, 2020 and Saturday, January 25, 2020. Turning movement count data for the weekday P.M. peak period (4:45 P.M. to 6:45 P.M.) and weekend (Saturday) peak period (7:30 P.M. to 9:30 P.M.) were utilized to determine existing conditions. The traffic volumes were collected in 15-minute intervals and the peak hour was determined. Turning movement counts also included pedestrian and bicycle data. Please note that the appropriate Florida Department of Transportation (FDOT) peak season factor of 1.03 was applied to the existing traffic volumes to account for peak season conditions. Existing signal phasing and timing patterns were obtained from Miami-Dade County Department of Transportation and Public

Works – Traffic Signals and Signs Division for the study intersection. The turning movement counts, FDOT peak season factor category report, and signal timing data are included in Attachment F-1.

Growth Rate Calculations

Future traffic growth on the transportation network was determined based upon (a) historic growth trends at nearby FDOT traffic count stations and (b) traffic volume comparisons from the year 2015 and 2045 Florida Standard Urban Transportation Model Structure (FSUTMS) - Southeast Florida Regional Planning Model (SERPM). FDOT count stations referenced in this analysis include:

- Count Station #2542: SR 907/Alton Road – 200 feet south of Venetian Causeway
- Count Station #8415: West Avenue – 100 feet north of 12th Street
- Count Station #8566: 15th Street – 200 feet east of Jefferson Avenue
- Count Station #8567: 16th Street – 200 feet east of Meridian Avenue

The historic growth rate analysis based on FDOT count stations determined a linear growth rate of negative 3.38 percent (-3.38%) annually over the most recent five (5) years and negative 1.28 percent (-1.28%) annually over the most recent ten (10) years. The exponential growth trend yielded a growth rate of negative 3.97 percent (-3.97%) annually over the most recent five (5) years and negative 1.27 percent (-1.27%) annually over the most recent ten (10) years. The decaying exponential growth trend yielded a growth rate of negative 3.77 percent (-3.77%) annually over the most recent five (5) years and negative 1.75 percent (-1.75%) annually over the most recent ten (10) years. Based on the forecasted volumes obtained from the 2015 and 2045 FSUTMS SERPM, an annual growth rate of 0.61 percent (0.61%) was calculated in the vicinity of the redevelopment.

Therefore, to provide a conservative analysis, the highest growth rate of 0.61 percent (0.61%) was applied to existing traffic volumes to determine future background traffic volumes for the project's expected opening year of 2022. The worksheets used to analyze the historic growth trends and volume development worksheets are included in Attachment G-1.

Future Traffic Volumes

Future total traffic conditions are defined as the expected traffic conditions in the year 2022 after the opening of the project. Total traffic volumes considered in the analysis for this project are the sum of the background traffic volumes and expected project traffic volumes. Volume development worksheets and figures summarizing the existing volumes, future background volumes, trip distribution, trip assignment, and future total volumes are provided in Attachment H-1.

Analysis

The operating conditions at the intersection of SR 907/Alton Road and 16th Street were analyzed for four (4) scenarios (existing conditions, future background conditions, future total conditions with 16th street valet operations, and future total conditions with SR 907/Alton Road valet operations using Trafficware's *SYNCHRO 10* software, which applies methodologies outlined in the Transportation Research Board's (TRB's) *Highway Capacity Manual* (HCM) 6th Edition. Synchro worksheets for the study intersections are included in Attachment I-1. A summary of the intersection analysis for the weekday P.M. peak hour and weekend (Saturday) peak hour is presented in Table 2. As indicated in Table 2, the intersection of SR 907/Alton Road and 16th Street is expected to operate at LOS D under

existing conditions and at LOS E under future background and future total conditions during the weekday P.M. peak hour. Additionally, the intersection of SR 907/Alton Road and 16th Street is expected to operate at LOS D under existing conditions and at LOS F under future background and future total conditions during the weekend peak hour. Note that per the direction of the City of Miami Beach, an exclusive pedestrian phase was included as part of the signal operating plan for the intersection of SR 907/Alton Road and 16th Street under future background and future total conditions.

Table 2: Peak Hour Intersection Capacity Analysis						
Intersection	Traffic Control	Overall LOS	Approach LOS			
			EB	WB	NB	SB
Existing Conditions (Future Background Conditions)						
[Future Total Conditions with 16 th Street Valet] {Future Total Conditions with Alton Road Valet}						
Weekday P.M. Peak Hour						
SR 907/Alton Road and 16 th Street	Signalized ⁽¹⁾⁽²⁾	D	D	F	C	B
		(E)	(D)	(F)	(E)	(D)
		[E]	[E]	[F]	[E]	[E]
		{E}	{E}	{F}	{E}	{E}
Weekend Peak Hour						
SR 907/Alton Road and 16 th Street	Signalized ⁽¹⁾⁽²⁾	D	D	F	C	B
		(F)	(D)	(F)	(D)	(E)
		[F]	[E]	[F]	[F]	[E]
		{F}	{E}	{F}	{F}	{E}

Notes:

⁽¹⁾HCM 2000 was utilized as HCM 6th Edition cannot analyze signalized intersections with an exclusive pedestrian phase

⁽²⁾Signal timings optimized under future background and future total conditions to account for the exclusive pedestrian phase

CONCLUSION

The project is expected to generate 48 net new vehicle trips during the A.M. peak hour, 57 net new vehicle trips during the P.M. peak hour, and 112 net new vehicle trips during the weekend (Saturday) peak hour of generator.

Based on the multimodal evaluation, sidewalk widths vary from approximately five (5) feet to 16 feet within the vicinity of the proposed redevelopment. Additionally, dedicated bicycle lanes are provided along 16th Street and sharrows are provided along Alton Road within the vicinity of the proposed redevelopment. Furthermore, protected bicycle lanes are programmed for implementation along 16th Street within the vicinity of the proposed redevelopment.

Transportation Demand Management (TDM) strategies are proposed to reduce the impacts of the project traffic on the surrounding roadway network. Typical measures promote bicycling and walking, encourage car/vanpooling and offer alternatives to the typical workday hours. The applicant will commit to providing the following incentives including:

- Providing transit information within the site including route schedules and maps
- Providing secure bicycle parking (bicycle racks and lockers)

Additionally, a valet operations analysis was conducted to determine the number of valet attendants and vehicle storage area required to accommodate the 95th percentile valet queue without extending beyond the valet service area onto 16th Street or Alton Road. Based upon the conservative assumptions applied to the highest traffic demand condition (Saturday peak hour of generator), it was estimated that a maximum of ten (10) valet attendants may be required at the 16th Street drop-off/pick-up area or a

maximum of 12 valet attendants may be required at the Alton Road drop-off/pick-up area during peak periods. It should be noted that projected vehicular volumes and estimated valet processing times were conservatively assumed in the analysis. If it is determined that valet processing times can be performed more efficiently, and/or actual traffic volumes are lower than projected, a reduced number of valet attendants may be adequate to serve the site.

Based on the intersection capacity analysis, the intersection of SR 907/Alton Road and 16th Street is expected to operate at LOS D under existing conditions and at LOS E under future background and future total conditions during the weekday P.M. peak hour. Additionally, the intersection of SR 907/Alton Road and 16th Street is expected to operate at LOS D under existing conditions and at LOS F under future background and future total conditions during the weekend peak hour. Note that per the direction of the City of Miami Beach, an exclusive pedestrian phase was included as part of the signal operating plan for the intersection of SR 907/Alton Road and 16th Street under future background and future total conditions.

If you have any questions regarding this analysis, please feel free to contact me.

Sincerely,

KIMLEY-HORN AND ASSOCIATES, INC.

Firat/Josiel:

Good evening. Per today's call, we have updated our methodology memorandum for your records.

Thanks,

John

John J. McWilliams, P.E.

John,

Although the checklist may seem extensive, these items are typically addressed in every traffic study. We provide this list as reference. We would be happy to go over it with you. We can setup a call for 1PM tomorrow?
Thank you

Firat Akcay

Firat:

Good afternoon. Thank you for providing. We are surprised by the extensive requirements you have outlined given our previous call, the development's size, the current data collection situation, and our timeline. Would it be possible to have a call tomorrow afternoon to discuss the requirements and reach a consensus? Please advise.

Thanks,

John

Subject: Re: 1575 Alton Road/Firestone - Traffic Assessment Methodology Submittal

Hello John,

Please see comments below:

1. The existing use of the Project hasn't been active for more than 3 years which disqualifies it to be considered as an existing use.
2. Considering a diner/breakfast place has an increased demand during weekend brunch times, we require an analysis period of the weekends to be included in the study.
3. The bicycle and pedestrian modes of transportation must be analyzed while utilizing the local, county and federal LOS criteria. We have recently collected data at the immediate intersection of Alton Road and 16th Street which will be provided to you.
4. Valet analysis must be conducted at the parking spaces on 16th Street as well as on Alton Road in the event the 16th Street parking lane elimination will be necessary as part of the intersection improvements.

Please see attached checklist. We will try to get you the concepts of 16th Street as soon as they become available.

Thank you

Memorandum

To: Firat Akcay
City of Miami Beach

Cc: Josiel Ferrer, P.E.
City of Miami Beach

From: John McWilliams, P.E. 

Date: April 22, 2020

**Subject: 1575 Alton Road Redevelopment
Traffic Study Methodology**

The purpose of this memorandum is to summarize the traffic study methodology for the proposed redevelopment of the property located at 1575 Alton Road in Miami Beach, Florida as discussed during the April 8, 2020 and April 22 conference calls with City of Miami Beach staff. Currently, the existing site is occupied by a 11,849 square-foot automobile service and tire shop. The proposed redevelopment includes a 102-seat restaurant, 207-seat restaurant, and 770 square-foot bakery. Note the existing automobile service and tire shop is not currently operational and will be demolished as part of the proposed redevelopment. A project location map and site plan are included in Attachment A. The following sections summarize our proposed methodology.

TRIP GENERATION

Trip generation calculations for the proposed redevelopment were performed using Institute of Transportation Engineers' (ITE) *Trip Generation Manual*, 10th Edition. The trip generation for the proposed redevelopment was determined using ITE LUC 931 (Quality Restaurant) and 939 (Bread/Donut/Bagel Shop without Drive-Through Window).

A multimodal (public transit, bicycle, and pedestrian) factor based on US Census *Means of Transportation to Work* data was reviewed for the census tracts in the vicinity of the site. The US Census data indicated that there is a 50.2 percent (50.2%) multimodal factor within the vicinity of the site. However, to provide a conservative analysis, a multimodal factor of 20.0 percent (20.0%) was applied to the trip generation calculations to account for the urban environment in which the project site is located. It is expected that a portion of employees, guests, and patrons will choose to walk, bike, or use public transit to and from the site.

Pass-by capture trip rates were determined based on average rates provided in the ITE's *Trip Generation Handbook*, 3rd Edition. The pass-by rate for the restaurant land use is 44.0 percent (44.0%) during the P.M. peak hour.

The project is expected to generate 48 net new vehicle trips during the A.M. peak hour, 57 net new vehicle trips during the P.M. peak hour, and 112 net new vehicle trips during the weekend (Saturday) peak hour of generator. Detailed trip generation calculations are included as Attachment B.

DATA COLLECTION

Peak period turning movement counts will be provided by the City of Miami Beach at the intersection of 16th Street and Alton Road. Please note that field observations will not be conducted as traffic data will be provided by the City. The traffic counts will be adjusted to peak season conditions using the appropriate Florida Department of Transportation (FDOT) peak season category factor. All traffic counts will be collected in 15-minute intervals during the peak periods. Turning movement counts will also include pedestrians and bicyclists. Signal timing information will be obtained from Miami-Dade County Department of Transportation and Public Works – Traffic Signals and Signs Division. All traffic data collected will be provided in the Appendix of the traffic study.

TRIP DISTRIBUTION

Trip distribution will be determined based on the location of the vehicle drop-off/pick-up area location and parking facilities used by the proposed redevelopment. Additionally, the distribution will be based on an interpolated cardinal trip distribution for the project site's traffic analysis zones (TAZs) obtained from the Miami-Dade Transportation Planning Organization's (TPO's) *2045 Long Range Transportation Plan Directional Trip Distribution Report* travel demand model 2015 and 2045 data. The project is located within TAZ 642. Therefore, a cardinal distribution was developed based on this TAZ. The traffic study will include graphics of the project traffic assignment and valet trips at the project's drop-off/pick-up area and off-site valet parking lot. The cardinal distribution is provided in Attachment C.

BACKGROUND GROWTH RATE

A background growth rate will be calculated based on historic growth trends at nearby FDOT traffic count stations. Additionally, growth rates based on the Florida Standard Urban Transportation Model Structure (FSUTMS) Southeast Regional Planning Model (SERPM) projected 2015 and 2045 model network volumes will be examined. The higher of the two (2) growth rates will be used in the analysis. Documentation will be provided in the Appendix of the traffic study. Please note that the City did not identify any committed developments to be included as part of future conditions.

CAPACITY ANALYSIS

Intersection capacity analyses will be conducted for the weekday A.M., weekday P.M., and weekend peak hours consistent with the data provided by the City at the study intersection. Intersection capacity analyses will be performed using *Synchro 10* traffic engineering analysis software which applies the Transportation Research Board's (TRB's), *Highway Capacity Manual* (HCM), 2000, 2010, and 6th Edition methodologies. Intersection capacity analyses will be conducted for the vehicle, bicycle, and pedestrian modes under three (3) scenarios: existing, future build-out without project (future background conditions), and future build-out with project (future total conditions). A build-out year of 2022 will be used in the analysis.

The following figures will be included for the study intersections:

- Existing conditions
- Future background traffic conditions (with growth rate and committed development traffic)
- Trip distribution
- Trip assignment
- Future total traffic conditions (with project)

MULTIMODAL EVALUATION

Multimodal facilities including existing and committed bicycle and pedestrian amenities within the vicinity of the proposed redevelopment will be documented in the traffic study.

SITE LOADING OPERATIONS PLAN

A description of the delivery and sanitary truck loading operations as part of the proposed redevelopment will be documented in the traffic study.

TRANSPORTATION DEMAND MANAGEMENT STRATEGIES

Transportation Demand Management (TDM) strategies will be developed to reduce the impact of project traffic on the surrounding roadway network and promote trip reduction. Typical measures promote bicycling and walking, encourage car/vanpooling and offer alternatives to the typical workday hours.

DOCUMENTATION

The results of the traffic study will be summarized in a report. The report will include supporting documents including trip generation calculations and text and graphics necessary to summarize the assumptions and analysis. An electronic copy of the report will be provided as part of the submittal package.

VALET ANALYSIS

A valet operations queuing analysis will be prepared for two (2) scenarios: i.) vehicle drop-off/pick-up area located along the south side of 16th Street just east of Alton Road and ii.) vehicle drop-off/pick-up area located along the east side of Alton Road just south of 16th Street. The valet operations analysis will be prepared to ensure that queues do not spill back into public right-of-way. If necessary, the vehicle drop-off/pick-up area for the valet operation will be coordinated with the City of Miami Beach Parking Department.

Trip generation estimates will be utilized to provide for the highest demand scenario. The highest demand scenario will be based on the trip generation estimate for the proposed redevelopment during the weekend (Saturday) peak hour of generator. Note that the project is expected to generate 112 vehicle trips during the weekend (Saturday) peak hour of generator. Please note that a 42.6 percent (42.6%) taxi/rideshare factor was applied to the trip generation estimates based on actual field observation from the Cadillac Hotel located at 3925 Collins Avenue to account for taxi/rideshare trips. Therefore, the project is expected to generate 64 valet trips during the weekend (Saturday) peak hour of generator and will be utilized in the valet analysis. Data related to taxi/rideshare trips is provided in Attachment D.

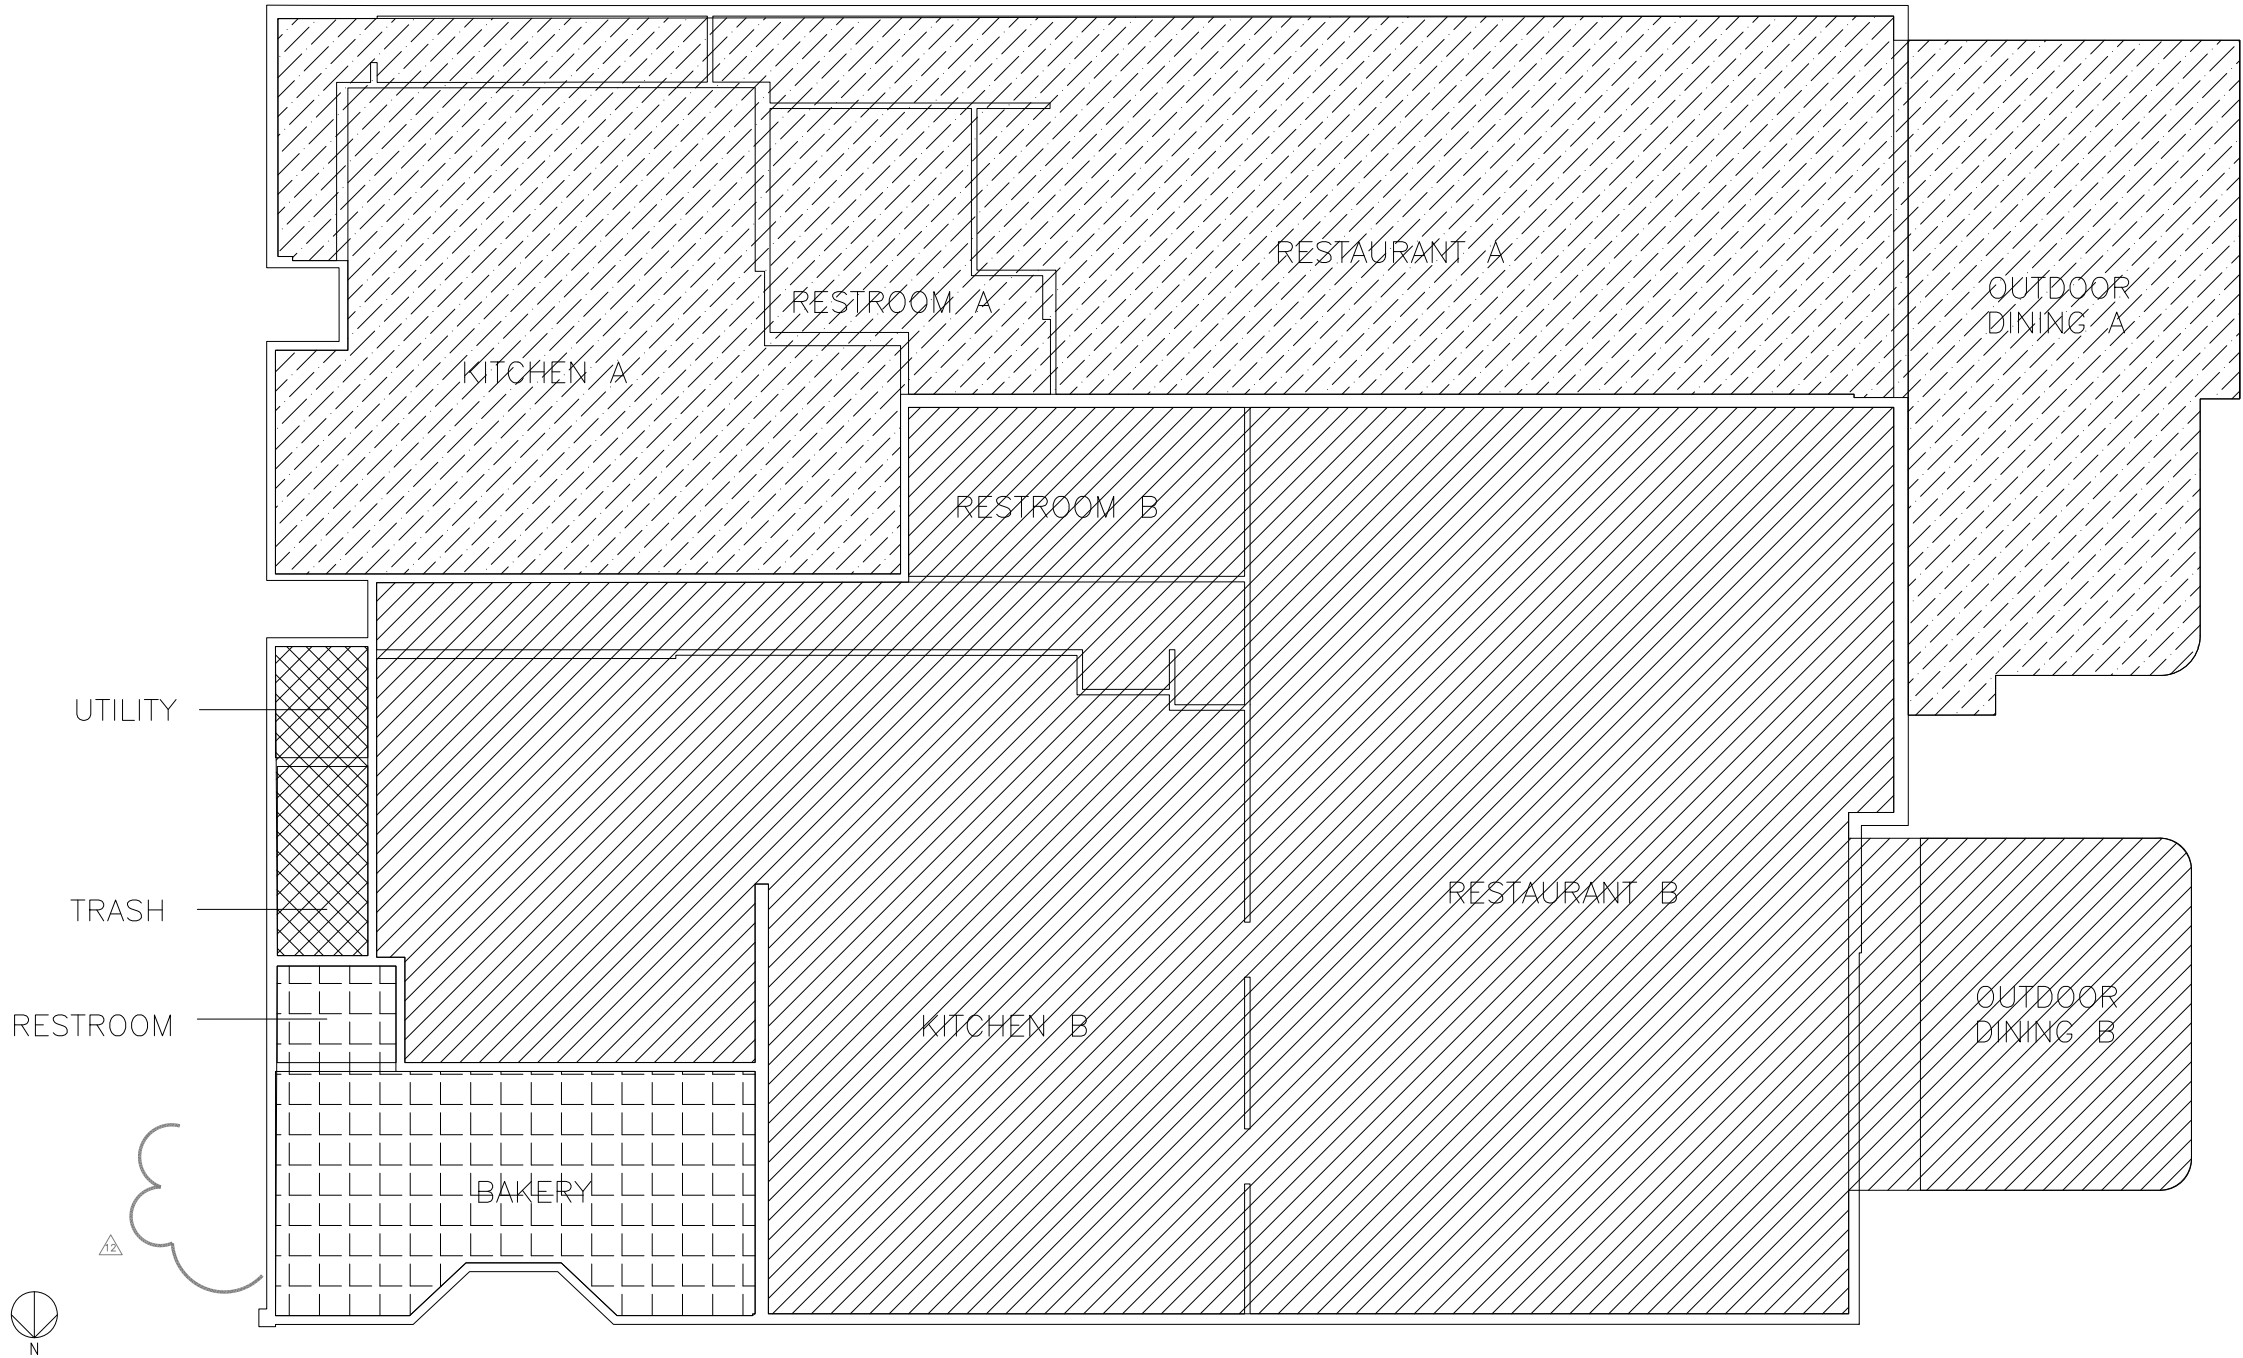

The valet operations queuing analysis will be conducted consistent with procedures described in ITE's *Transportation and Land Development*, 1988. A traffic circulation figure will be prepared to illustrate the valet routes to and from the vehicle drop-off/pick-up area. The analysis will include the assumptions and results, including the location of the off-site valet parking lot along with the number of on-site parking spaces assigned for valet operations and the required number of valet attendants to service the facility under highest demand conditions.

MEANS OF TRANSPORTATION TO WORK

Survey/Program:

American Community Survey

Universe:

Workers 16 years and over

Year:

2018

Estimates:

5-Year

Table ID:

B08301

Source: U.S. Census Bureau, 2018 American Community Survey 1-Year Estimates

Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities, and towns and estimates of housing units for states and counties.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see ACS Technical Documentation). The effect of nonsampling error is not represented in these tables.

Workers include members of the Armed Forces and civilians who were at work last week.

While the 2018 American Community Survey (ACS) data generally reflect the July 2015 Office of Management and Budget (OMB) delineations of metropolitan and micropolitan statistical areas, in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB delineations due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Explanation of Symbols:

An "***" entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.

An "-" entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution, or the margin of error associated with a median was larger than the median itself.

An "-" following a median estimate means the median falls in the lowest interval of an open-ended distribution.

An "+" following a median estimate means the median falls in the upper interval of an open-ended distribution.

An "***" entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.

An "*****" entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.

An "N" entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.

An "(X)" means that the estimate is not applicable or not available.

Supporting documentation on code lists, subject definitions, data accuracy, and statistical testing can be found on the American Community Survey website in the Technical Documentation section.

Sample size and data quality measures (including coverage rates, allocation rates, and response rates) can be found on the American Community Survey website in the Methodology section.

MEANS OF TRANSPORTATION TO WORK

Survey/Program:

American Community Survey

Universe:

Workers 16 years and over

Year:

2018

Estimates:

5-Year

Table ID:

B08301

Source: U.S. Census Bureau, 2018 American Community Survey 1-Year Estimates

Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities, and towns and estimates of housing units for states and counties.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see ACS Technical Documentation). The effect of nonsampling error is not represented in these tables.

Workers include members of the Armed Forces and civilians who were at work last week.

While the 2018 American Community Survey (ACS) data generally reflect the July 2015 Office of Management and Budget (OMB) delineations of metropolitan and micropolitan statistical areas, in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB delineations due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

Explanation of Symbols:

An "***" entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.

An "-" entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution, or the margin of error associated with a median was larger than the median itself.

An "-" following a median estimate means the median falls in the lowest interval of an open-ended distribution.

An "+" following a median estimate means the median falls in the upper interval of an open-ended distribution.

An "***" entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.

An "*****" entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.

An "N" entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.

An "(X)" means that the estimate is not applicable or not available.

Supporting documentation on code lists, subject definitions, data accuracy, and statistical testing can be found on the American Community Survey website in the Technical Documentation section.

Sample size and data quality measures (including coverage rates, allocation rates, and response rates) can be found on the American Community Survey website in the Methodology section.

We are asking customers to use public transit and STS services for essential trips only. Fares have been suspended for riders who depend on public transportation for essential trips. Transit services and trip frequencies have been adjusted. Some Metrobus express routes have been suspended. Customer Service and STS offices are closed until further notice. Please use our online services and mobile applications to stay connected.

Valet Analysis

Weekend Peak Hour Parking Garage Valet Drop-Off/Pick-Up Analysis

Arrival Rate	IN	OUT
	37	27

veh/hr

Service Rate	IN	OUT
	7.20	5.50

mins/veh

Number of Valet Attendants (N) = 10

Level of Confidence = 0.95

Storage Provided On-Site = 3 vehicles

Total Entering and Exiting Vehicles(q) = 64 veh/hr

Service Capacity per N (60 mins/Service Rate) (Q) = 9.26 veh/hr/pos

Average Service Rate (t) = 6.48 mins/veh

rho (t/Q) = 0.692

Expected (avg.) number of vehicles in the system	E(m)=	0.47	
Expected (avg.) number of vehicles waiting in queue	E(n)=	7.38	
Mean time in the queue	E(w)=	0.44	mins
Mean time in system	E(t)=	6.92	mins

Proportion of customers who wait (P) (E(w) > 0)= 20.90%

Probability of a queue exceeding a length (M) P(x > M)= 5.00%

Queue length which is exceeded 5.00% of the times is equal to 2.9 vehicles
