**RE: Ritz-Carlton Sagamore Miami Beach Trip Generation and Queuing Analysis - #21111**

Dear Firat,

The Ritz-Carlton Sagamore development is located at 1 Lincoln Road in Miami Beach, Florida. (See Attachment A for the site plan). The Ritz-Carlton Sagamore Miami Beach development is proposing an addition to the Sagamore Hotel that will replace 93 rooms within the hotel with a mixed-use tower consisting of 52 multifamily dwelling units and 53 hotel rooms. The traffic caused by the addition will utilize the same parking garage and optional valet drop-off / pick-up service area as the existing Ritz-Carlton Hotel located at the east end of Lincoln Road. (Residential parking will be available on the first floor of the existing parking garage). Vehicular access to the site will be provided via Lincoln Road, east of SR-A1A. The residential loading will utilize the hotel's existing loading bays located at the southwest corner of the Ritz-Carlton parking garage, west of the garage entrance. Access to the loading area is also provided on Lincoln Road. The residential loading will follow the same loading restrictions that the hotel currently utilizes. All loading will be restricted between the hours of 9 am and 5 pm and will have to be scheduled and managed by the loading areas' dockmaster. Pedestrian access to the addition will be through the existing lobby of the Ritz-Carlton Hotel or through the main entrance of the existing Sagamore Hotel (located on the east side of A1A). Short and long-term bicycle parking will be available in the southeast corners of the first and basement levels of the parking garage.

The purpose of this traffic statement is to conduct a trip generation analysis and queuing analysis for the proposed residential / hotel tower addition. A trip generation analysis was performed to estimate the trips during the AM and PM peak hour of the adjacent street. A queuing analysis was performed at the valet station to analyze if the queues will exceed the provided valet storage. Trip generation was also performed to establish the critical morning or afternoon peak volumes to use for the queuing analysis.

### **Trip Generation**

A trip generation analysis was conducted for the proposed Sagamore Miami Beach project. The project trip generation was based on the rates/equations published by the Institute of Transportation Engineers (ITE) *Trip Generation Manual*, 10<sup>th</sup> Edition. Land Use 221, Multifamily Housing Mid-Rise and Land Use 310, Hotel were used in the analysis. A 20% reduction for other modes of transportation was applied at the request of the City. Trip generation calculations were performed for a typical weekday daily, AM and PM peak hours of the adjacent street. Trip generation for the proposed and existing site are summarized in Exhibit 1. Support documentation is provided in Attachment B.

### **Exhibit 1 Trip Generation**

<b>Existing</b>	<b>624</b>	<b>13</b>	<b>10</b>	<b>23</b>	<b>12</b>	<b>11</b>	<b>23</b>
<b>Net Trip Difference</b>	<b>-170</b>	<b>1</b>	<b>8</b>	<b>9</b>	<b>4</b>	<b>2</b>	<b>6</b>

<sup>1</sup> Based on ITE Trip Generation Manual, 10<sup>th</sup> Edition.

<sup>2</sup> A 20% reduction was used for the transportation reduction per City request.

The results of the analysis show that the proposed Ritz-Carlton Sagamore tower will generate 170 less daily trips than the existing hotel and a total increase of 9 and 6 vehicle trips during morning and afternoon peak hours respectively.

### **Queuing Analysis**

As previously stated, the proposed tower will utilize the existing parking garage and valet station. The existing valet station is located on Lincoln Road at the existing Ritz-Carlton entrance under a porte-cochere. A queuing analysis was performed for the valet station to determine if a queue will form at the proposed valet reception area that will spill back onto Lincoln Road and interfere with the internal circulation of vehicles entering and exiting the parking garage.

The queuing analysis for the proposed valet drop-off / pick-up area was performed based on the methodology outlined in the *Institute of Transportation Engineers (ITE) Transportation and Land Development*. The analysis was performed to determine the number of valet parking attendants required during the peak hour so that the queue does not extend past the valet storage area (95% confidence level analysis). The potential queues were calculated based on the peak hour traffic published by the Institute of Transportation Engineers (ITE) trip generation rates and/or equations. As the valet station currently serves and will continue to serve the traffic from the Ritz-Carlton Hotel and the proposed Sagamore Hotel residential tower, trip generation for the existing Ritz-Carlton Hotel and the Sagamore Hotel’s proposed development plan was performed to determine the demand at the valet station. The PM peak hour of generator (worst case scenario) was used for the purpose of calculating the expected queues at the valet station. A 20% reduction for other modes of transportation and a 44% rideshare reduction were applied at the request of the City.

As previously mentioned hotel guests and residents have the option to self-park or use valet parking. Residential parking will be available within the first level of the parking garage, valet parking will utilize the basement level of the existing parking garage. (See attachment C for valet and residential access exhibits). For the valet station it was assumed that 80% of the hotel guests and 20% of the residents would use the valet services. The proposed AM and PM peak hours of generator trip generation is summarized in Exhibit 2. Queuing and queuing trip generation documentation are available in Attachment C.

**Exhibit 2**  
**Valet Trip Generation**

ITE Land Use Designation <sup>1</sup>	Number of Units	AM Peak Hour of Generator Vehicle Trips			PM Peak Hour of Generator Vehicle Trips		
		In	Out	Total	In	Out	Total

<b>Net Proposed Trips</b>		<b>56</b>	<b>53</b>	<b>109</b>	<b>72</b>	<b>52</b>	<b>124</b>
Demand at Valet Station <sup>4</sup>		43	38	81	53	39	92

<sup>1</sup> Based on ITE Trip Generation Manual, 10<sup>th</sup> Edition.

<sup>2</sup> A 20% reduction was used for the transportation reduction per City request.

<sup>3</sup> A 44% rideshare reduction was used at the valet station per City request.

<sup>4</sup> See Attachment C for Residential / Hotel Valet Demand Calculations

The results of the trip generation show that the critical peak hour for valet parking is the PM peak hour of the generator with a total of 92 vehicle trips (in/out).

The queuing analysis used the single-channel waiting line model with Poisson arrivals and exponential service times. The analysis is based on the coefficient of utilization ( $\rho$ ) which is the ratio of the average arrival rate of vehicles to the average service rate.

$$\rho = \frac{\text{Average Demand Rate}}{\text{Average Service Rate}}$$

The average service rate corresponds to the time it will take a valet parking attendant to park or retrieve a vehicle. If the coefficient of utilization is greater than 1, then the calculation will yield an infinite queue length.

The required queue storage (M) is determined using the following equation:

$$M = \left\lceil \frac{\ln P(x > M) - \ln Q_M}{\ln \rho} \right\rceil - 1$$

In this equation,  $P(x > M)$  is set at 5% to yield a 95% confidence that the queue will not back-up onto the adjacent street.

Since the distance from the valet drop-off / pick-up area differs for inbound and outbound trips, a weighted average was taken of the inbound / outbound valet processing time. The weighted average was based on the inbound / outbound trip distribution, which is 58% inbound and 42% outbound.

The processing rates were calculated by adding the time it will take a valet attendant to process the vehicles (**processing time**), the time it will take the attendant to circulate to the parking space (**driving time**), the time it will take the attendant to park or retrieve a vehicle (**park processing time**), and the time it will take the attendant to walk to/from the parking area (**walking time**).

A processing time of 60 seconds per vehicle was used in the analysis. This information was provided by the City of Miami Beach. The driving time for the valet attendant was calculated on a conservative speed of 15 mph, and the walking time for the valet attendant was calculated on a jogging speed of 5 ft / sec (provided by the City). The valet processing rate for the valet station can be seen in Exhibit 3.

**Exhibit 3**  
**Valet Station Processing Rate**  
**Valet Drop-off / Pick-up**

**Valet Time (Inbound)**

<i>Processing time:</i>	$60 \text{ sec} / 60 \text{ sec} / 1 \text{ min} = 1.00 \text{ min}$
<i>Driving time:</i>	$865 \text{ ft} * 1 \text{ mile} / 5280 \text{ ft} * 1 \text{ hr} / 15 \text{ miles} * 60 \text{ min} / \text{hr} = 0.66 \text{ min}$
<i>Park Processing Time:</i>	$= 0.15 \text{ min}$
<i>Walking time:</i>	$575 \text{ ft} / 5 \text{ ft} / \text{sec} / 60 \text{ sec} / \text{min} = 1.92 \text{ min}$
<b>Total</b>	<b><u>= 3.72 min</u></b>

**Valet Time (Outbound)**

<i>Processing time:</i>	$60 \text{ sec} / 60 \text{ sec} / 1 \text{ min} = 1.00 \text{ min}$
<i>Driving time:</i>	$630 \text{ ft} * 1 \text{ mile} / 5280 \text{ ft} * 1 \text{ hr} / 15 \text{ miles} * 60 \text{ min} / \text{hr} = 0.48 \text{ min}$
<i>Park Processing Time:</i>	$= 0.15 \text{ min}$
<i>Walking time:</i>	$575 \text{ ft} / 5 \text{ ft} / \text{sec} / 60 \text{ sec} / \text{min} = 1.92 \text{ min}$
<b>Total</b>	<b><u>= 3.54 min</u></b>

**Weighted Valet Time**

<i>58% Inbound:</i>	$0.58 * 3.72 \text{ min} = 2.16 \text{ min}$
<i>58% Outbound:</i>	$0.42 * 3.54 \text{ min} = 0.68 \text{ min}$
<b>Total</b>	<b><u>= 2.84 min</u></b>

An iterative approach was used to determine the minimum number of valet attendants required during the PM peak hour to serve both the entering and exiting vehicles that will ensure that the average queue at the valet station will not extend past the valet storage. Exhibit 4 shows the calculations for the inbound / outbound valet drop-off / pick-up area during the PM peak hour of the generator.

**Exhibit 4**  
**Valet Station Queuing Calculations**

$$Q = \text{Processing Rate} = \frac{60 \text{ min/hr}}{2.84 \text{ min/process}} = 21.11 \text{ process/hr}$$

$$q = \text{Demand Rate} = 92 \frac{\text{veh}}{\text{hr}}$$

$$N = \text{Service Positions} = 8 \text{ Attendants}$$

$$\rho = \text{Utilization factor} = \frac{q}{(NQ)} = \frac{92 \text{ veh/hr}}{8 \times 21.11 \text{ process/hr}} = 0.5448$$

$$Q_m = \text{Table Value} = 0.0951$$

$M =$  queue length which is exceeded 5% of the time  $[P(x>M)]$

$$M = \frac{\ln P(x>M) - \ln(Q_m)}{\ln(\rho)} - 1 = \frac{\ln(0.05) - \ln(0.0951)}{\ln(0.5448)} - 1 = 0.058, \text{ say 1 Vehicle on queue}$$

The results of the analysis show that a total of 8 valet attendants would be able to handle the demand during the PM peak hour of generator at the valet station with an average queue of approximately one vehicle or less. Based on the site plan, the valet station has approximately 60 feet of storage; this distance is enough to accommodate two vehicles in the queue. It should be noted that the queuing analysis considers the worst case scenario during the peak hours to make sure that the queue never spills onto the public right-of-way or interferes with site operations. Once operational, the development can assess the actual need for valet attendants at different times of the day.

**Conclusion**

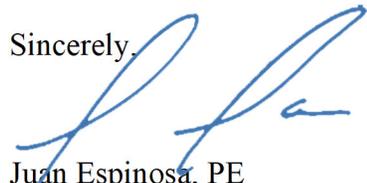

The Ritz-Carlton Sagamore project is proposing an addition that will replace 93 rooms of the existing Sagamore Hotel with a mixed-use tower consisting of 52 residential units and 53 hotel rooms. The tower is anticipated to generate 170 less daily trips than the existing site and only adds a total of 9 and 6 vehicle trips during morning and afternoon peak hours respectively. As the addition is adding less than 10 trips to the roadway network during peak hours, the additional vehicle trips and impacts on the adjacent roadway network can be consider *de minimis*.

As discussed above, the new tower will utilize the parking within the existing parking garage and the valet station provided on Lincoln Road at the existing Ritz-Carlton entrance. The results of the analysis show that a total of 8 valet attendants would be able to handle the demand during the PM

peak hour of generator (worst case scenario) at the drop-off / pick-up area with an average queue of approximately 1 vehicle or less. It is our professional opinion that the additional trips from the proposed tower will not have an adverse impact on the operations of the existing valet station on Lincoln Road and will not impede the access to/from the existing parking garage. A Transportation Demand Management (TDM) plan was developed for the project and added as Attachment D.

We stand ready to provide any support needed for this project. Should you have any questions or comments, please call me at (305) 447-0900.

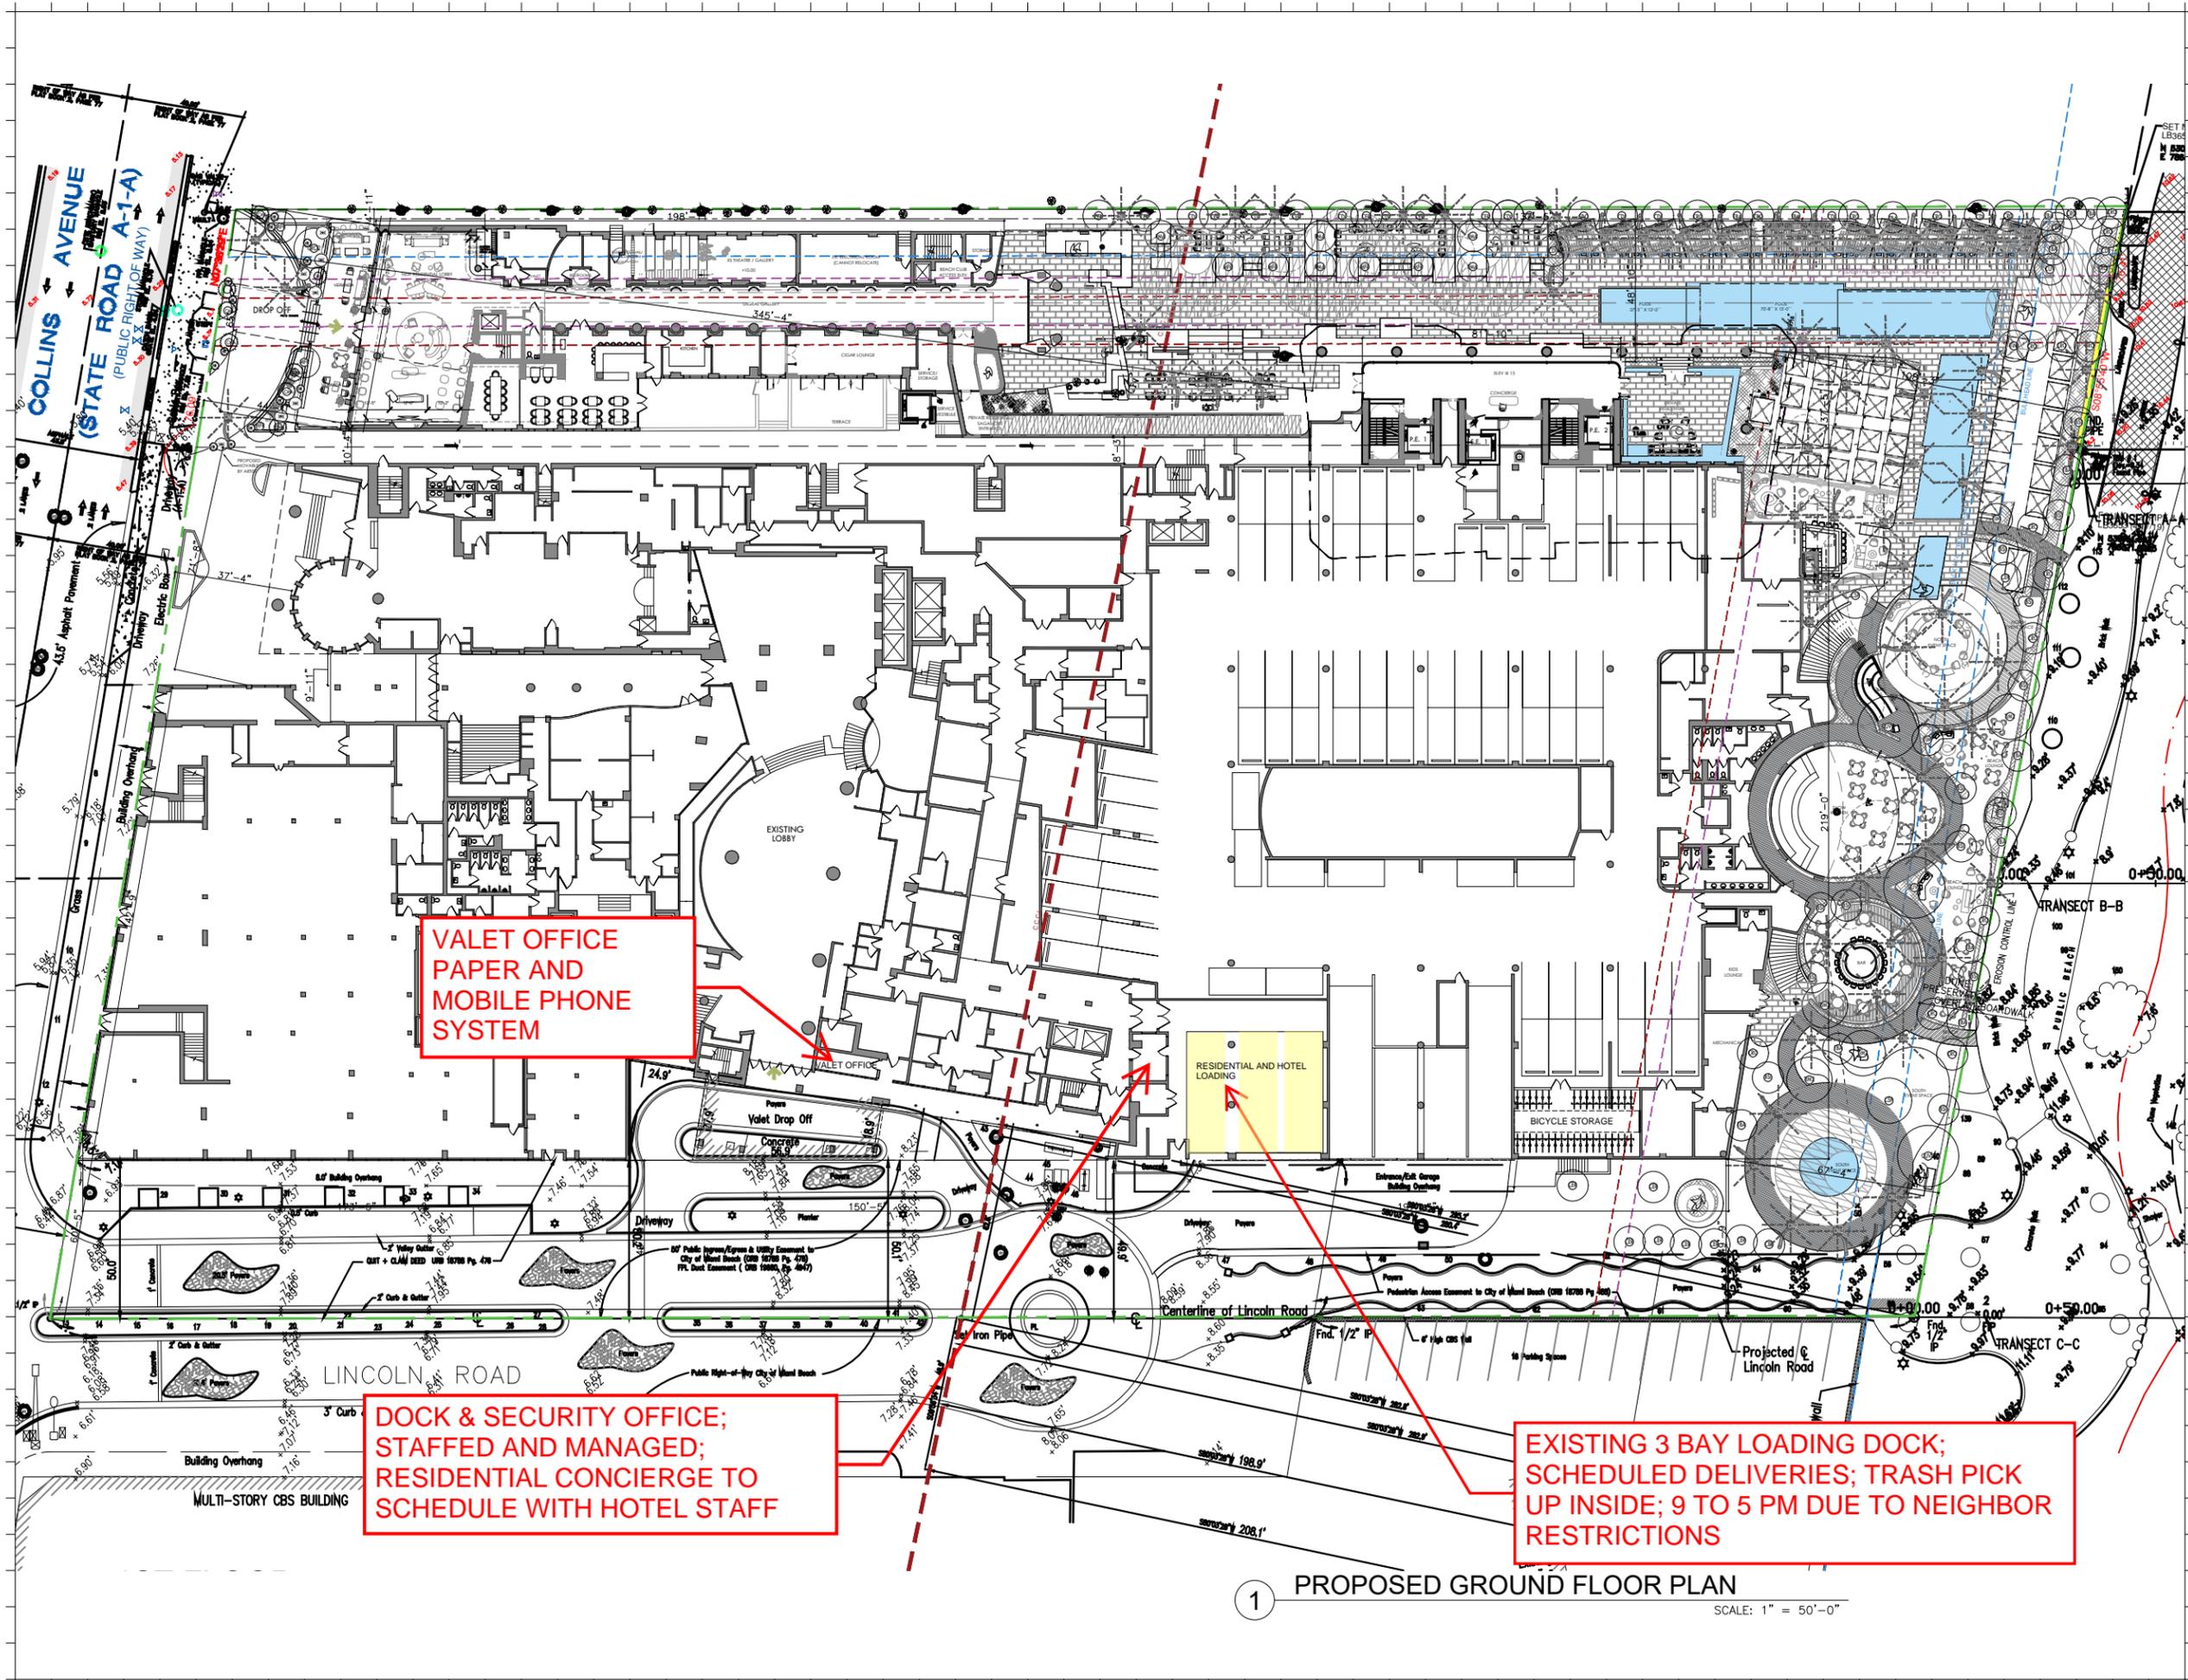

Sincerely,

Juan Espinosa, PE  
Vice-President – Transportation

### COMMUTING CHARACTERISTICS BY SEX

**Survey/Program:**

American Community Survey

**Year:**

2018

**Estimates:**

5-Year

**Table ID:**

S0801

Although the American Community Survey (ACS) produces population, demographic and housing unit estimates, it is the Census Bureau's Population Estimates Program that produces and disseminates the official estimates of the population for the nation, states, counties, cities, and towns and estimates of housing units for states and counties.

Source: U.S. Census Bureau, 2014-2018 American Community Survey 5-Year Estimates

When information is missing or inconsistent, the Census Bureau logically assigns an acceptable value using the response to a related question or questions. If a logical assignment is not possible, data are filled using a statistical process called allocation, which uses a similar individual or household to provide a donor value. The "Allocated" section is the number of respondents who received an allocated value for a particular subject.

Data are based on a sample and are subject to sampling variability. The degree of uncertainty for an estimate arising from sampling variability is represented through the use of a margin of error. The value shown here is the 90 percent margin of error. The margin of error can be interpreted roughly as providing a 90 percent probability that the interval defined by the estimate minus the margin of error and the estimate plus the margin of error (the lower and upper confidence bounds) contains the true value. In addition to sampling variability, the ACS estimates are subject to nonsampling error (for a discussion of nonsampling variability, see ACS Technical Documentation ). The effect of nonsampling error is not represented in these tables.

The 12 selected states are Connecticut, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, and Wisconsin.

Workers include members of the Armed Forces and civilians who were at work last week.

While the 2014-2018 American Community Survey (ACS) data generally reflect the February 2013 Office of Management and Budget (OMB) definitions of metropolitan and micropolitan statistical areas; in certain instances the names, codes, and boundaries of the principal cities shown in ACS tables may differ from the OMB definitions due to differences in the effective dates of the geographic entities.

Estimates of urban and rural populations, housing units, and characteristics reflect boundaries of urban areas defined based on Census 2010 data. As a result, data for urban and rural areas from the ACS do not necessarily reflect the results of ongoing urbanization.

**Explanation of Symbols:**

An "\*\*\*" entry in the margin of error column indicates that either no sample observations or too few sample observations were available to compute a standard error and thus the margin of error. A statistical test is not appropriate.

An "-" entry in the estimate column indicates that either no sample observations or too few sample observations were available to compute an estimate, or a ratio of medians cannot be calculated because one or both of the median estimates falls in the lowest interval or upper interval of an open-ended distribution, or the margin of error associated with a median was larger than the median itself.

An "-" following a median estimate means the median falls in the lowest interval of an open-ended distribution.

An "+" following a median estimate means the median falls in the upper interval of an open-ended distribution.  
An "\*\*\*" entry in the margin of error column indicates that the median falls in the lowest interval or upper interval of an open-ended distribution. A statistical test is not appropriate.  
An "\*\*\*\*\*" entry in the margin of error column indicates that the estimate is controlled. A statistical test for sampling variability is not appropriate.  
An "N" entry in the estimate and margin of error columns indicates that data for this geographic area cannot be displayed because the number of sample cases is too small.  
An "(X)" means that the estimate is not applicable or not available.

Supporting documentation on code lists, subject definitions, data accuracy, and statistical testing can be found on the American Community Survey website in the Technical Documentation section.

Sample size and data quality measures (including coverage rates, allocation rates, and response rates) can be found on the American Community Survey website in the Methodology section.

Data Source: Trip Gen Manual, 10th Ed	Urban/Suburban				$\ln(T) = 0.83\ln(X) - 0.05$	60%	40%	
310(4) - Hotel	General	Rooms	374	Weekday, PM Peak Hour of Generator	Best Fit (LOG)	125	90	215
Data Source: Trip Gen Manual, 10th Ed	Urban/Suburban				$\ln(T) = 0.93\ln(X) - 0.14$	58%	42%	

location, a 5% probability of back-up onto the adjacent street is judged to be acceptable. Demand on the system for design is expected to be 110 vehicles in a 45-minute period. Average service time was expected to be 2.2 minutes. Is the queue storage adequate?

Such problems can be quickly solved using Equation (8-9b) given in Table 8-10 and repeated below for convenience.

$$M = \left[ \frac{\ln P(x > M) - \ln Q_M}{\ln \rho} \right] - 1$$

where:

$M$  = queue length which is exceeded  $p$  percent of the time

$N$  = number of service channels (drive-in positions)

$Q$  = service rate per channel (vehicles per hour)

$\rho = \frac{\text{demand rate}}{\text{service rate}} = \frac{q}{NQ}$  = utilization factor

$q$  = demand rate on the system (vehicles per hour)

$Q_M$  = tabled values of the relationship between queue length, number of channels, and utilization factor (see Table 8.11)

**TABLE 8-11**  
Table of  $Q_M$  Values

$P$	$N = 1$	2	3	4	6	8	10
0.0	0.0000	0.0000	0.0000	0.0000			
0.1	.1000	.0182	.0037	.0008	.0000	0.0000	0.0000
.2	.2000	.0666	.0247	.0096	.0015	.0002	.0000
.3	.3000	.1385	.0700	.0370	.0111	.0036	.0011
.4	.4000	.2286	.1411	.0907	.0400	.0185	.0088
.5	.5000	.3333	.2368	.1739	.0991	.0591	.0360
.6	.6000	.4501	.3548	.2870	.1965	.1395	.1013
.7	.7000	.5766	.4923	.4286	.3359	.2706	.2218
.8	.8000	.7111	.6472	.5964	.5178	.4576	.4093
.9	.9000	.8526	.8172	.7878	.7401	.7014	.6687
1.0	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000	1.0000

$$\rho = \frac{q}{NQ} = \frac{\text{arrival rate, total}}{(\text{number of channels})(\text{service rate per channel})}$$

$N$  = number of channels (service positions)

### Solution

Step 1:  $Q = \frac{60 \text{ min/hr}}{2.2 \text{ min/service}} = 27.3$  services per hour

Step 2:  $q = (110 \text{ veh/45 min}) \times (60 \text{ min/hr}) = 146.7$  vehicles per hour

Step 3:  $\rho = \frac{q}{NQ} = \frac{146.7}{(6)(27.3)} = 0.8956$

Step 4:  $Q_M = 0.7303$  by interpolation between 0.8 and 0.9 for  $N = 6$  from the table of  $Q_M$  values (see Table 8-11).

Step 5: The acceptable probability of the queue,  $M$ , being longer than the storage, 18 spaces in this example, was stated to be 5%.  $P(x > M) = 0.05$ , and:

$$M = \left[ \frac{\ln 0.05 - \ln 0.7303}{\ln 0.8956} \right] - 1 = \left[ \frac{-2.996 - (-0.314)}{-0.110} \right] - 1$$

$$= 24.38 - 1 = 23.38, \text{ say } 23 \text{ vehicles.}$$

## **TRANSPORTATION DEMAND MANAGEMENT PLAN**

The project's design and location will reduce the project vehicular traffic volumes as follows:

- The project is a proposed residential tower will be located in the existing Sagamore Hotel and will connect to the existing Ritz-Carlson Hotel. The existing hotels provide various onsite restaurants, retail, and recreational facilities which will result in a portion of the trips being captured within the development, or internal to the site.
- The project is offering covered bicycle storage for tenants, employees, and retail patrons on the southeast side of the parking garage.
- The project is located in South Beach, an extremely walkable and pedestrian area that offers the following:
  - Sidewalks along all roadways, midblock-crosswalks, and crosswalks at signalized intersections.
  - Various restaurants, retail, and recreational facilities (beaches, escape rooms, tours, ect.)
  - A CitiBike station is located approximately 0.1 miles southwest of the project location
  - A Bike and Segway rental shop is located approximately 0.1 mile west of the project location
- The project is in South Beach which provides residents, employees, and visitor's accessibility to mass transit. This feature will allow residents to use mass transit for their trip to/from home, work, and recreation. The closest transit stops to the project are located along the northeast side of the Washington Avenue / Lincoln Road intersection and south side of Lincoln Road approximately 200 feet east of the Washington Avenue / Lincoln Road intersection. These two stops accommodate the following transit:
  - The Collins Express and Middle Beach Loop trolleys
  - Miami-Dade bus routes: S, 115, M, 150, 120, and C.

The development will also do the following to further reduce peak hour vehicle trips:

- Will encourage employers / landlords to participate in ridesharing programs through South Florida Commuter Services. Available information will be obtained and distributed to all residents and employees in the development.
- Miami-Dade County Transportation Agency current local and regional mass transit route and schedule information will be provided to potential transit users in a prominent public area of the development. The information provided and maintained on the premises will be updated, when necessary, at no less than six month intervals.

The location and implementation of these items will result in a reduction of peak hour vehicle trips.
