September 29, 2023

Re: 1940 Bay Drive – Traffic Statement

Dear Monika:

Traf Tech Engineering, Inc. has prepared this traffic statement in connection with the proposed re-development of an existing two-story residential apartment complex consisting of 23 units. The site is located at 1940 Bay Drive in the City of Miami Beach, Miami-Dade County, Florida (refer to Figure 1). The existing residential development will be replaced with a 5-story, 12-unit residential development. The proposed site plan for the project is contained in Attachment A. This traffic report addresses the following topics:

- Trip Generation/Distribution
- Driveway Assignment
- Need for Turn Lanes
- Entry Gates/Queuing
- Valet Service
- Parking and Deliveries
- Transportation Demand Management

Trip Generation and Trip Distribution

A trip generation comparison analysis was performed for the site using the trip generation equations published in the Institute of Transportation Engineer's (ITE) *Trip Generation Manual (11th Edition)*. The trip generation analyses were undertaken for daily, AM peak hour, and PM peak hour conditions.

According to ITE's *Trip Generation Manual (11th Edition)*, the trip generation equations used for the analyses are presented below (refer to Attachment B):

Multifamily Housing – Low Rise (ITE Land Use 220)

Daily Trips

$$T = 6.74 (X)$$

Where T = average daily vehicle trip ends and X = number of units

AM Peak Hour

$$T = 0.40 (X) \text{ with 24\% inbound and 76\% outbound}$$

Where T = AM peak hour trip ends and X = number of units

PM Peak Hour

T = 0.51 (X) with 63% inbound and 37% outbound

Where T = PM peak hour trip ends and X = number of units

Multifamily Housing – Mid Rise (ITE Land Use 221)

Daily Trips

T = 4.54 (X)

Where T = average daily vehicle trip ends and X = number of units

AM Peak Hour

T = 0.37 (X) with 23% inbound and 77% outbound

Where T = AM peak hour trip ends and X = number of units

PM Peak Hour

T = 0.39 (X) with 61% inbound and 39% outbound

Where T = PM peak hour trip ends and X = number of units

Using the above-listed trip generation equations from the ITE document, a trip generation comparison analysis was undertaken for the 1940 Bay Drive project. The results of this effort are documented in Tables 1 and 2. As shown in the table, the 12-unit residential development is projected to generate approximately 54 daily trips, approximately four (4) AM peak hour trips and approximately five (5) trips during the typical afternoon peak. When compared against the existing 23-unit development at the site, the proposed project will reduce trips from Normandy Isle.

TABLE 1
Trip Generation Summary (Existing Use)
1940 Bay Drive

| Land Use | Size | Daily Trips | AM Peak Hour | | | PM Peak Hour | | |
|--------------------------------|----------|-------------|--------------|----------|----------|--------------|----------|----------|
| | | | Total Trips | Inbound | Outbound | Total Trips | Inbound | Outbound |
| Multifamily Low Rise (LUC 220) | 23 units | 155 | 9 | 2 | 7 | 12 | 8 | 4 |
| External Trips | | 155 | 9 | 2 | 7 | 12 | 8 | 4 |

| Proposed - Existing | -101 | -5 | -1 | -4 | -7 | -5 | -2 |

The trip distribution and traffic assignment for the project's peak trips was based on Miami-Dade County's Cardinal Distribution information for the study area. Table 3 summarizes the County's cardinal distribution data for Traffic Analysis Zone 625, which is applicable to the project site from the latest SERPM data published by Miami-Dade County (refer to Attachment C).

| TABLE 3 Project Trip Distribution TAZ #625 for 1940 Bay Drive | | | | | | | | |
|---|----------|------|------|-------|-------|-------|-------|-------|
| Year | Movement | | | | | | | |
| | NNE | ENE | ESE | SSE | SSW | WSW | WNW | NNW |

| 2045 | 9.1% | 2.0% | 0.0% | 9.5% | 14.1% | 31.5% | 14.6% | 19.3% |
| 2026* | 11.4% | 2.8% | 0.0% | 10.8% | 10.9% | 29.0% | 14.3% | 20.8% |

Notes: * Interpolated Values

Source: Miami-Dade County (2015 & 2045 SERPM)

Due to the small trips associated with the proposed 12-unit development, the following traffic assignment was assumed for the 1940 Bay Drive project:

- o 70% to/from the northwest via Bay Drive
- o 30% to and from the southeast via Bay Drive

Driveway Assignment

As shown in the site plan contained in Attachment A, access to the project will be provided via one inbound-only driveway and one outbound-only driveway. Figure 2 presents the AM and PM peak hour traffic volumes at the two access driveways.

Need for Turn Lanes

Based on the projected driveway volumes, an exclusive right-turn lane or left-turn lane are not warranted on Bay Drive.

Entry Gates and Queuing

Entry gates are proposed at the entrance to the east and west parking garages, as shown on the site plan. The distance between the west parking garage gate and the right-of-way line is approximately 40 feet (sufficient to accommodate two (2) vehicles).

A queuing analysis was conducted for the entry gate. The access to the east and west parking garages is proposed to be controlled by a gate system and transponder. Residents will have a vehicle card reader to operate the gate in order to minimize delays and queues. Visitors will not be allowed to use the gated entrance (they will use the nine on-street parking spaces). The queuing analysis was based on the following assumptions:

- During the peak inbound period (PM), three inbound vehicles are anticipated. All three vehicles were assumed to use the west parking garage.
- Several gate systems will be available for this project. Depending on the gate system implemented, the time to open the gate could vary between 3 and 12 seconds. For purposes of this evaluation, 12 seconds were assumed, for a service rate of 300 vehicle per hour.

Using the above assumptions, a queuing of one (1) vehicle is anticipated. Since the west garage gate is located approximately 40 feet from the property line, traffic entering the site will not spill onto Bay Drive. Attachment D includes a description of the queuing analysis and calculation details.

Valet Service

Valet service is not contemplated for this project.

Parking and Deliveries

Within the frontage of the 1940 Bay Drive residential development, there are 18 90-degree on-street parking spaces. These parking spaces are currently being used by the tenants of the 23 residential units located within the site. With the proposed redevelopment project, nine (9) on-street parking spaces will remain and nine (9) will be eliminated to provide access to the proposed parking garage for the future 12 residential units. Within the parking garage, there will be

a total of 24 off-street parking spaces. Hence, the proposed 12-unit development will result in more parking for future tenants and visitors than currently existing along the frontage of the 1940 Bay Drive site.

Coordination with the City of Miami Beach Parking Department will be held during the development of this project regarding the elimination of nine (9) on-street parking spaces.

Deliveries will occur on the one-way (eastbound) internal aisle between the entrance and exit driveways.

Transportation Demand Management

The project should incorporate the following strategies intended to reduce the use of private automobile:

- Transit information pamphlets including public transportation routes, schedules and maps should be provided at the lobby of the residential building.
- Designated bicycle parking in the parking garage.
- Wide (5-8 feet) hallways and elevators that can accommodate bicycles.
- Safe pedestrian connectivity to the existing sidewalk located on the south side of Bay Drive.

Please give me a call if you have any questions.

Sincerely,

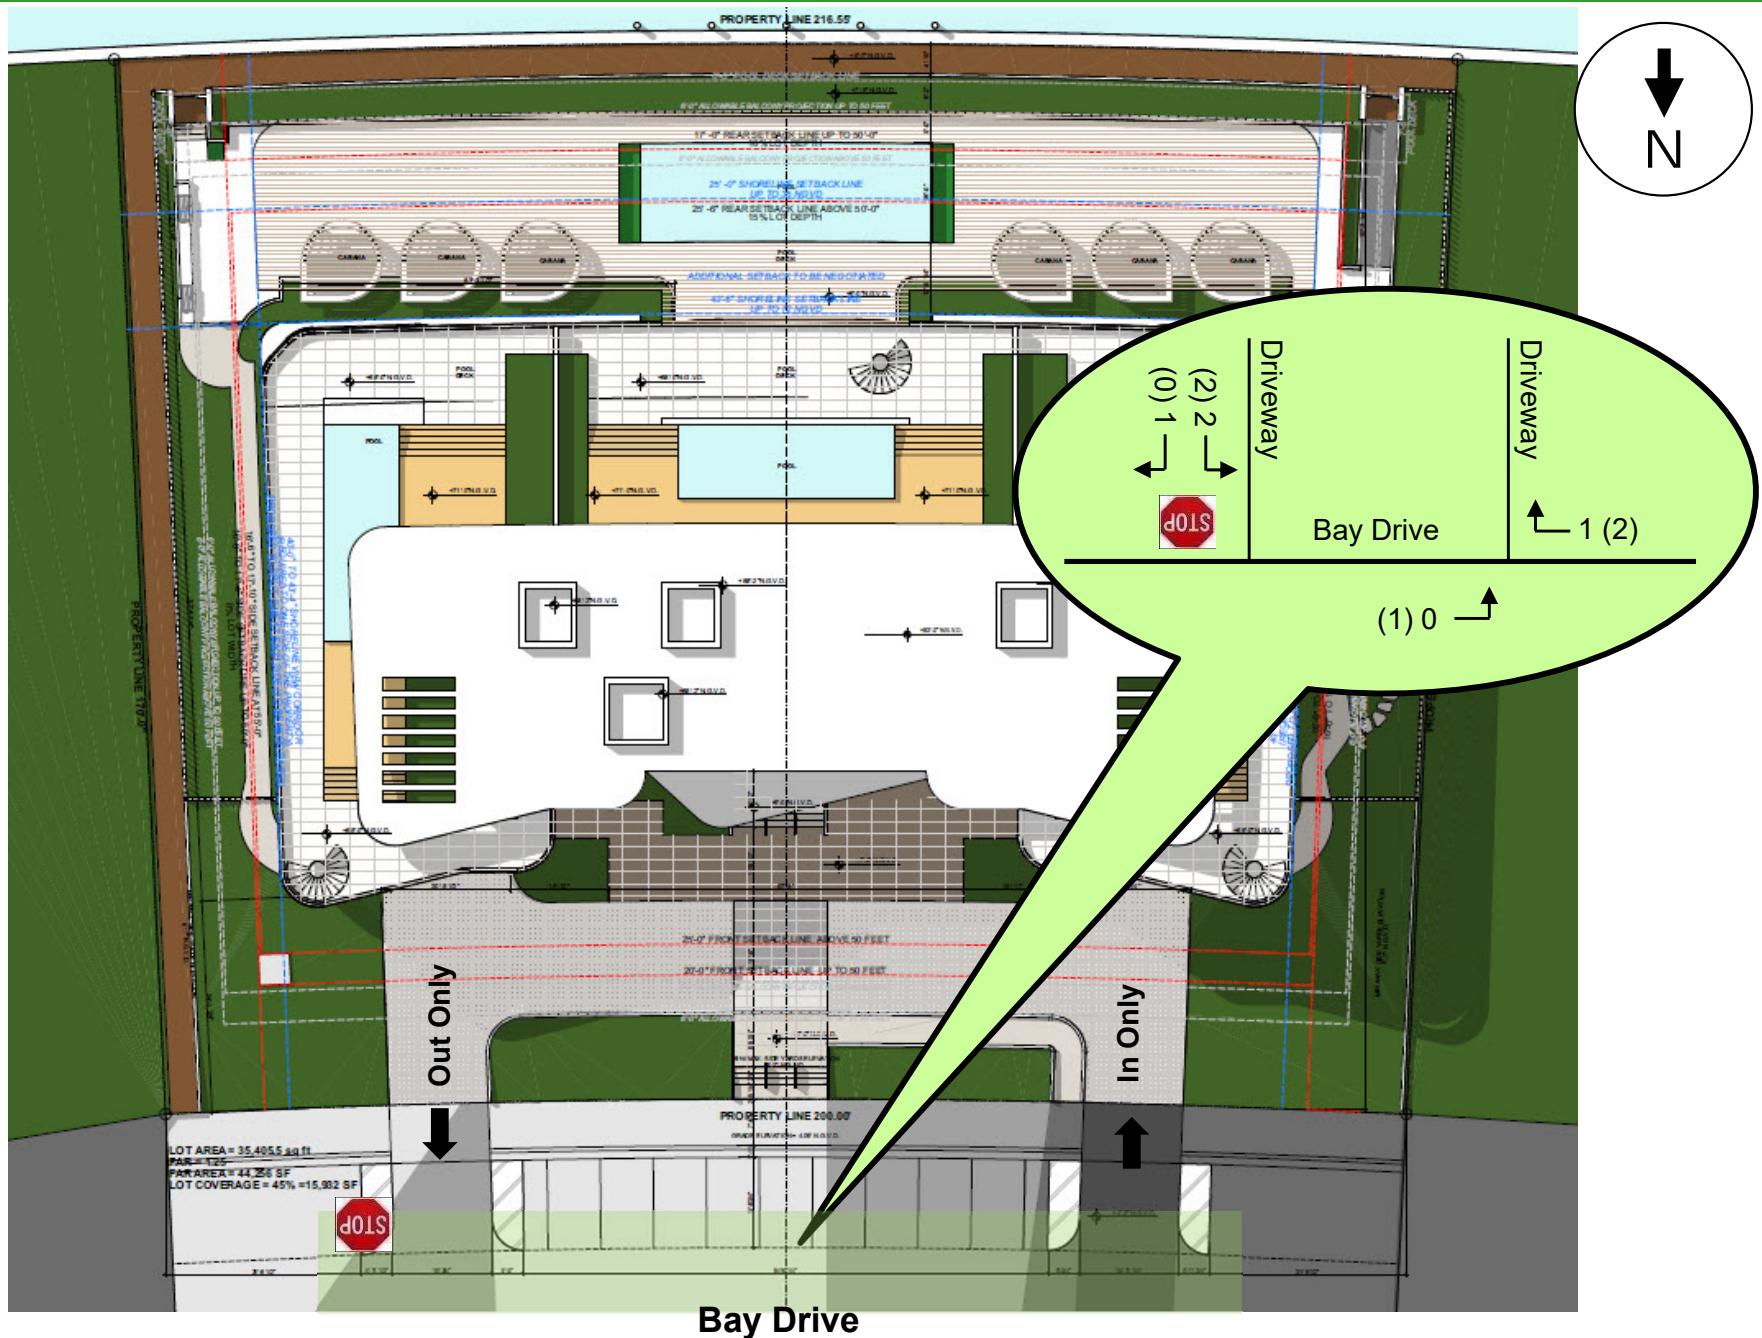

TRAFTech ENGINEERING, INC.

Joaquin E. Vargas, P.E.
Senior Transportation Engineer

ATTACHMENT D

Queuing Analysis

Queueing Analysis - PM Peak Hour

M= Queue length which is exceeded p percent of the time

$$M = \left[\frac{\ln P(x > M) - \ln Q_M}{\ln \rho} \right] - 1 \quad \text{where} \quad \ln P(x > M) = \ln 0.05$$

N= Number of service channels

Q= Service rate per channel (vph)

ρ = Demand rate/Service rate

$$\rho = \frac{q}{NQ}$$

q = Demand rate on the system (vph)

Q_M = Value obtained from Table 8.11 (refer to next page)

Gate Location- Residents Only

Q= 300 vph

q = 3 vph

N= 1

ρ = 0.0100

Q_M = 0.0100

M= -1.34949 \approx 1 vehicle

location, a 5% probability of back-up onto the adjacent street is judged to be acceptable. Demand on the system for design is expected to be 110 vehicles in a 45-minute period. Average service time was expected to be 2.2 minutes. Is the queue storage adequate?

Such problems can be quickly solved using Equation (8-9b) given in Table 8-10 and repeated below for convenience.

$$M = \left[\frac{\ln P(x > M) - \ln Q_M}{\ln \rho} \right] - 1$$

where:

M = queue length which is exceeded p percent of the time

N = number of service channels (drive-in positions)

Q = service rate per channel (vehicles per hour)

$\rho = \frac{\text{demand rate}}{\text{service rate}} = \frac{q}{NQ}$ = utilization factor

q = demand rate on the system (vehicles per hour)

Q_M = tabulated values of the relationship between queue length, number of channels, and utilization factor (see Table 8.11)

TABLE 8-11
Table of Q_M Values

| 1.0 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 | 1.0000 |

$$\rho = \frac{q}{NQ} = \frac{\text{arrival rate, total}}{(\text{number of channels})(\text{service rate per channel})}$$

N = number of channels (service positions)

Solution

$$\text{Step 1: } Q = \frac{60 \text{ min/hr}}{2.2 \text{ min/service}} = 27.3 \text{ services per hour}$$

$$\text{Step 2: } q = (110 \text{ veh}/45 \text{ min}) \times (60 \text{ min/hr}) = 146.7 \text{ vehicles per hour}$$

$$\text{Step 3: } \rho = \frac{q}{NQ} = \frac{146.7}{(6)(27.3)} = 0.8956$$

Step 4: $Q_M = 0.7303$ by interpolation between 0.8 and 0.9 for $N = 6$ from the table of Q_M values (see Table 8-11).

Step 5: The acceptable probability of the queue, M , being longer than the storage, 18 spaces in this example, was stated to be 5%. $P(x > M) = 0.05$, and:

$$M = \left[\frac{\ln 0.05 - \ln 0.7303}{\ln 0.8956} \right] - 1 = \left[\frac{-2.996 - (-0.314)}{-0.110} \right] - 1 \\ = 24.38 - 1 = 23.38, \text{ say 23 vehicles.}$$
